UNITED REPUBLIC OF TANZANIA, ADMINISTRATIVE BOUNDARIES

Foreword

This report presents the methodology and population projections based on the 2012 Population and Housing Census (PHC) data. The projection exercise was undertaken by the National Bureau of Statistics (NBS) in collaboration with the Office of the Chief Government Statistician, Zanzibar (OCGS). The results include projections of the total population by sex in single years and five-year age groups; and summary of some demographic indicators.

The success of the projection work depended upon the cooperation and contributions from the government, development partners and various institutions. A special word of thanks should go to UNFPA, USAID and TSMP basket funders for their financial support and UNAIDS and ESRF for their technical support. We would also like to thank experts from higher learning institutions in the country for their valuable technical support. Special thanks should also go to the Management of NBS and OCGS whose commitment and dedication made significant contributions to the overall efficiency of this work.

Special thanks should go to Dr. Thomas McDevitt, a Demographer from US Census Bureau who trained and guided the team on PASEX spreadsheets and basic computational techniques; and Dr. Mike Levin, an IT specialist on census data who guided the IT team on data cleaning and computation of the 2002 census data based on 2017 administrative structure.

Last but not least, we would wish to thank the whole National Team of Analysts: Dr. Albina Chuwa, Ms. Mayasa Mwinyi Mahfoudh, Mr. Irenius Ruyobya, Prof. M. Mbonile, Mr. Ahmed Makbel, Ms. Asia Hassan Mussa, Mr. Abdul-Majid Jecha, Mr. Seif Ahmad Kuchengo, Mr. Mdoka Omary, Ms. Sabina R. Daima, Mr. Bakar Kombo Omary, Mr. Ariv Severe, Eng. Ambose Mapande and Eng. Robert Sikumbili. This team of analysts is particularly thanked for their commitment, dedication and active participation in the production of these projections.

NBS and OCGS welcome comments and suggestions regarding these projections and other publications emanating from the 2012 Population and Housing Census. All comments and suggestions should be addressed to the Director General, National Bureau of Statistics, P.O. Box 796, Dar es Salaam, e-mail dg@nbs.go.tz, or to the Chief Government Statistician, Office of the Chief Government Statistician, P.O. Box 2331, Zanzibar, e-mail: zanlink@ocgs.go.tz.

Dr. Albina Chuwa,
Director General,
National Bureau of Statistics,
Dar es Salaam

Ms. Mayasa Mwinyi Mahfoudh,
Government Statistician,
Office of the Chief Government Statistician,
Zanzibar

Executive Summary

This report presents population projections for the period of 2013 to 2035 at National level, Tanzania Mainland and Tanzania Zanzibar. These population projections were made using Cohort Component Technique; of Rural Urban Projection Program (RUP) that was developed by the US Census Bureau, and Spectrum System which is a computer package that analyses existing information to determine the future consequence of today's development programmes and policies. These projections included three components for population change, namely: fertility, mortality and migration.

The report gives fertility, mortality, migration and HIV/AIDS assumptions used, and presents demographic and socio-economic future trends for Tanzania, Tanzania Mainland and Tanzania Zanzibar. The results include estimated total population by sex in single years and five-year age groups as well as the summary of demographic indicators.

It should be noted that, before projection, population was adjusted to mid-year of 2012 using population growth rate based on estimated fertility and mortality. This provided the adjusted population estimates by using MOVEPOP spreadsheets. During this process, National projection was adjusted to accommodate five (5) percent of under-enumerated population during census undertaking as revealed by Post-Enumeration Survey (PES).

For the period of 2013 to 2035, it is assumed that the population growth of the country will decrease. The national projections show that the Tanzania population growth rate will decrease from 3.1 percent in 2013 (with a population of 46,356,279) to 2.8 percent in 2035 (with a population of 89,204,781). For the Tanzania Mainland population growth rate will also decrease from 3.1 in 2013 (with a population of 45,007,503) to 2.8 percent in 2035 (with a population of 86,871,546). In Tanzania Zanzibar, the population growth rate will decrease from 3.4 percent in 2013 (with a population of 1,348,776) to 1.9 percent in 2035 (with a population of 2,333,235).

As for mortality, Infant Mortality Rates (IMRs) in Tanzania and Tanzania Mainland are expected to decline for both sexes from 43 deaths per 1,000 live births in 2013 to 13 deaths per 1,000 live births in 2035. For Tanzania Zanzibar, IMR is projected to decline from 38 deaths per 1,000 live births in 2013 to 13 deaths per 1,000 live births in 2035.

The mortality estimates further show that life expectancy at birth for both Tanzania and Tanzania Mainland will increase from 62 years in 2013 to 74 years in 2035 for both sexes. For the male population, life expectancy at birth for Tanzania and Tanzania Mainland will increase from 60

years in year 2013 to 71 years in 2035, while life expectancy at birth for the female population will increase from 64 years in 2013 to 77 years in 2035. For Tanzania Zanzibar, life expectancy at birth will increase from 66 years in 2013 to 73 years in 2035 for both sexes. For the male population, life expectancy at birth will increase from 64 years in year 2013 to 70 years in 2035, while life expectancy at birth for the female population will increase from 67 years in 2013 to 77 years in 2035.

On fertility, the Total Fertility Rate (TFR) will decline from 5.3 children per woman in 2013 to 4.1 children per woman in 2035 for both Tanzania and Tanzania Mainland. For Tanzania Zanzibar, the TFR will decrease from 4.9 children per woman in 2013 to 3.2 children per woman in 2035.

Chapter One

Introduction

1.1 Background

The 2012 Population and Housing Census was the fifth to be undertaken after the Union of Tanganyika and Zanzibar in 1964, the Union that gave birth to the United Republic of Tanzania. The census was carried out on 26th August, 2012 with the main objective of providing accurate and reliable population data to the government and other users. Censuses provide up-to-date and reliable data that are essential for the formulation of realistic development plans and making informed decisions for socio-economic development.

Censuses are among most important sources of demographic and socio-economic data in the country for the preparation, monitoring and evaluation of social and economic development policies and programmes such as the 2025 Tanzania Development Vision and the Zanzibar Poverty Reduction Plan (ZPRP). Likewise, census data with other information from administrative sources and surveys are of paramount importance in evaluating and monitoring international development programmes like the 2030 Sustainable Development Goals (SDGs) and Africa Agenda of 2063.

Evaluation of the quality of the census data is often necessary to determine whether data collection was properly done and that the data are of acceptable quality. Evaluation and quality control measures were undertaken at pre-enumeration, enumeration and post-enumeration stages. At each stage, quality standards were established and implemented to minimize errors in the population and housing census data.

In this report, the methodology used to make projections based on the 2012 Population and Housing Census data is presented together with the projected population for the period of 2013 to 2035 at National level, Tanzania Mainland and Tanzania Zanzibar. It is anticipated that the projections in this report will be used by data users for monitoring and evaluating progress made towards achieving 2025 Tanzania Development Vision, the 2020 Zanzibar Development Vision and other national and international development agenda.

Population can be projected by interpolation or extrapolation. If the desired date is between census dates, then an interpolation method is the desired one. Projected population is obtained by interpolating between the two censuses. Interpolation can be made using either the same cohort or the same age groups in the census.

Cohort interpolation is advisable if the age information is reliable. Moreover, this technique is recommended if data are available by single years for populations that have actual and significant age fluctuations. In addition, information on annual intercensal births is needed for determining the number of persons born during the inter-censal period (i.e. those who were only enumerated in the preceding census).

Interpolation, using the same age groups in each census, is frequently used in developing countries including Tanzania, since information on single years is unreliable and the age structure usually does not have actual fluctuations. The procedure is acceptable particularly when the interpolation date is close to the census date. The interpolation can be made either linearly or exponentially. If the desired date is close to one of the census dates, both possibilities give similar results. However, if the interpolation date is several years from the census date, linear interpolation produces higher values than exponential interpolation. In most cases, the exponential interpolation is more suitable than the linear interpolation.

Another procedure for adjusting the population is to shift or move the population from a given date (for instance, a census date) to another date (for instance midyear). If the total population for the desired date is available, extrapolation can be used. Another possibility is to use the levels of mortality, fertility and migration to estimate a population growth rate, and then use the growth rate to calculate the total population at the desired date. Once the new total has been calculated, the age structure can be adjusted proportionately to the new total. The base population used for projections was based on extrapolated population taking into consideration the levels of mortality, fertility, migration and HIV/AIDS.

Nevertheless, the most commonly used method for projecting populations is the cohort component method, which projects each age and sex cohort over time based on components of growth. Annual births create new cohorts, while existing cohorts are decreased by mortality and either increased or decreased by migration (US Census Bureau 2013). In this report, cohort component method was used to project population and is briefly discussed below.

1.3 The Population Projection Software

The population projection software used for this projection are Rural Urban Projection Program (RUP) that was developed by US Census Bureau and Spectrum system which is a computer package that analyses existing information to determine the future consequence of today's development programmes and policies.

The RUP program has features that allow a considerable amount of flexibility for specifying projected trends in fertility, mortality and migration. The software also includes a wealth of output options that allow a detailed examination of results. Some of these features are summarized below:

- i. The projection is performed using single years of age;
- ii. The projection is performed year by year;
- iii. Input data for the population and components can be provided in either single year or 5-year age groups;
- iv. The program accepts mortality and fertility rates as inputs and it also allows the input of numbers of births, deaths and/or migrants; and
- v. The program provides output of a wide variety of demographic measures for any specified year of the projection. These outputs include:
 - a. Population by sex and age (single years, 5-year age groups, special groups) and summary measures of age (e.g., percentages, sex ratios, median ages, dependency ratios);
 - b. Summary of vital rates (e.g., crude birth and death rates, life expectancy, infant mortality rates, and total fertility rates);
 - c. Life tables;
 - d. Net numbers of migrants or migration rates by age and sex;
 - e. Number of deaths, by age and sex; and
 - f. Number of births, by age of mother, and age-specific fertility rates.

On the other side, Spectrum is a Windows-based system of integrated policy models. The integration is based on Demographic Projection (DemProj), which is used to create population projections that support many of the calculations in other components, such as AIDS Impact Model (AIM).

The DemProj is a computer program for making population projections for countries or regions. The program requires information on the number of people by age and sex in the base year, as well as current year data and future assumptions about the Total Fertility Rate (TFR), the age distribution of fertility, life expectancy at birth by sex, the most appropriate model life table, and the magnitude and pattern of international migration.

This information is used to project the size of the future population by age and sex for many years into the future. If desired, the projection can also be used to estimate the size of the urban and rural populations. Linking DemProj with other modules in the Spectrum makes it possible to examine the demographic impact of AIDS.

Generaly, projection can be made for one or two areas. If two areas are projected, the program can calculate a third area as the sum of the two areas (e.g., total = rural + urban) or the difference (e.g., urban = total - rural).

Flexibility of these programmes have a clear advantage of allowing a demographer to create a projection model that accurately reflects the demographic situation in a country and making maximum use of available data in as close as possible to its original form. However, this flexibility comes at a price as it places a burden on the demographer to decide on the best way to model the situation (since the program does not limit the options) and to provide accurate data for all the inputs required to run the program.

Chapter Two

Methodology

2.1 Introduction

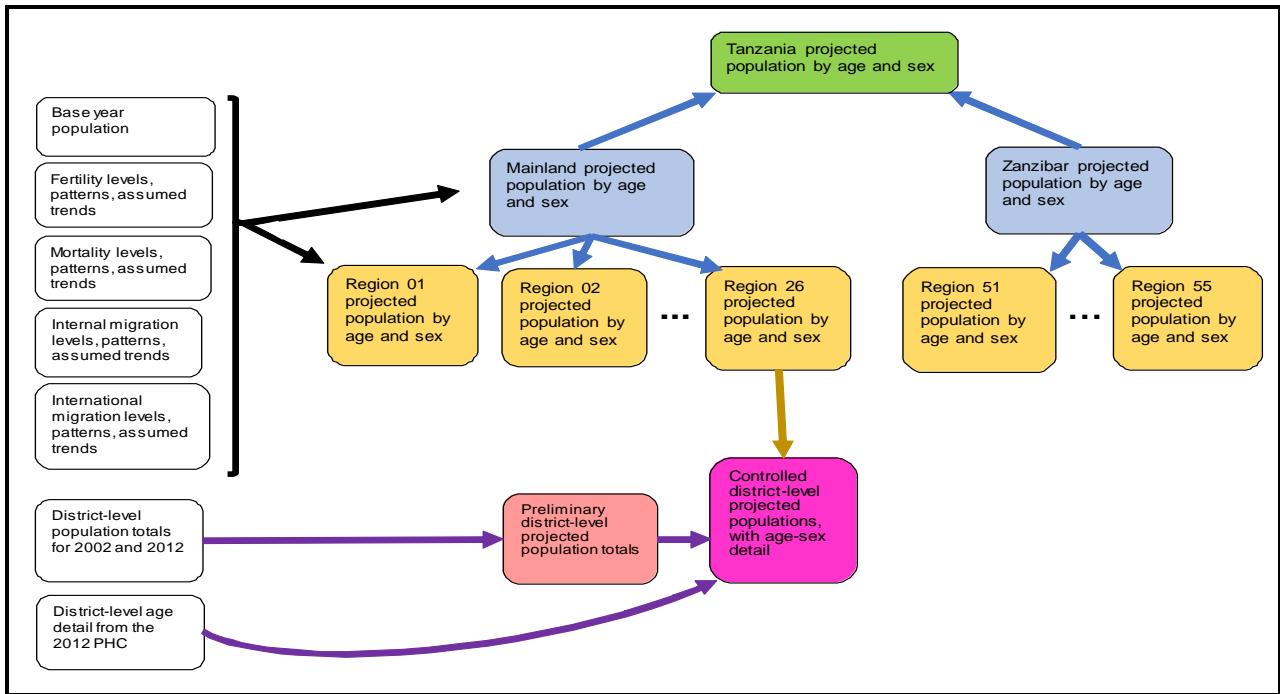

Population projections for regions, Tanzania Mainland and Tanzania Zanzibar, based on the 2012 Population and Housing Census (PHC), have been made using a cohort-component model. An adjusted population taken from the 2012 PHC, disaggregated by age in single years and sex, has been projected one year at a time, with births, net internal migrants and net international migrants added each year, and deaths subtracted each year from 2012 to 2035.

Tanzania's national projection is the sum of the Tanzania Mainland and Tanzania Zanzibar projections. Regional projections have been controlled to the Tanzania Mainland and Tanzania Zanzibar projections, ensuring complete consistency between the regional, Tanzania Mainland and Tanzania Zanzibar, and Tanzania projections. The process, working from projection inputs to a larger geographical area and regional cohort-component projections, to an aggregated projection for Tanzania and to controlled, mathematically extrapolated projected populations with age-sex detail is shown in Figure 2.1.

The region-specific, Tanzania Mainland, and Tanzania Zanzibar cohort-component projections are central to the process. For each area, population with age and sex details taken from the 2012 Population and Housing Census (PHC) is adjusted then projected one year at a time from 2012 to 2035 using assumptions about the components of growth – fertility, mortality, internal and international migration.

Administrative regions as they are defined in 2017 rather than those existed in 2012, at the time of the 2012 PHC, have been used for projection. Specifically, separate projections have been prepared for Songwe and for the new Mbeya region, based on new tabulations of population and migration from the 2012 PHC but assumed shared fertility and mortality.

Figure 2. 1: The process used to Prepare Projections based on the 2012 PHC

2.2 Base Year Population

The projected population of Tanzania Mainland and Tanzania Zanzibar is based on adjusted 2012 age-sex-specific populations. Population under age 10 was evaluated by comparing the reported census counts for ages 0-4 and 5-9 with estimated population consistent with census-based fertility and mortality. This was done by applying the BASEPOP.XLS spreadsheet.

The following inputs were used to obtain the base population:

- i. Reported population distribution by five-year age-groups and sex obtained from the 2012 Population and Housing Census;
- ii. Sex ratio at birth (male births per 100 female births) was assumed to be 103;
- iii. Mortality data at two points in time that is earlier (2002) and later (2012); these are nLx values for males and females;
- iv. Earlier and later date fertility data were Age Specific Fertility Rates (ASFRs) from the 2004-05 and 2010 Tanzania Demographic and Health Surveys (DHS). This is due to the fact that TDHS provides more reliable fertility information compared with the PHC. Furthermore, TDHS fertility data collection is based on birth history of individual women.

The next step was to move the population to a desired point in time (mid-year of 2012) using population growth rate based on estimated fertility and mortality. This provided the adjusted population estimates by using MOVEPOP spreadsheets. During this process, the National

projections were adjusted to accommodate five (5) percent of underenumerated population during the 2012 PHC undertaking as revealed by the Post-Enumeration Survey (PES).

The inputs used in the MOVEPOP were:

- i. Adjusted population disaggregated by five-year age groups and sex generated from BASEPOP.XLS spreadsheets;
- ii. Age-Specific Central Death Rates - $M(x)$ – these estimates were generated from LTPOPDTH.XLS spreadsheets; and
- iii. Age-Specific Fertility Rate - the same as those applied in BASEPOP.XLS spreadsheets.

Each area-specific population under age 5, and population ages 5 to 9 for some areas were adjusted upward to be consistent with fertility and mortality. Population ages 10 and above was evaluated for possible age heaping and, when found, smoothed using Arriaga's "light" smoothing technique. Care was taken not to smooth out distortions in age structure possibly attributable to in- or out-migration.

2.3 Fertility Assumptions and Estimation

2.3.1 Introduction

Estimation of fertility levels for Tanzania and its regions from the 2012 PHC is based on the number of live births by age of mother in the 12 months preceding the census and the number of children ever born by age of mother reported by women aged 15-49 years. However, given the limitations of the 2012 PHC data, several indirect methods were used to estimate adjusted fertility indicators to evaluate the direct estimates of age-specific and total fertility rates based on births in the year preceding the census. Apart from the PHC data, projections are based on data from 2004-05, 2010 and 2015-16 TDHS.

In general, the PHC data and all three demographic surveys have shown that fertility, as one of the important components of population change, is slowly decreasing in Tanzania.

2.3.2 Fertility Estimation

Fertility and age-specific fertility were indirectly estimated from 2002 and 2012 PHC data on children ever born and the number of births in the twelve months preceding each census using Arriaga's technique¹. Arriaga estimates at the national level were adjusted to be consistent with a series of ten-year average total fertility rates from the 2004, 2010 and 2015/16 DHS.

¹ Ibid. (209-210 and Appendix IV-7).

Trend in the fertility level (total fertility rate - TFR) was estimated for areas and most regions by fitting a logistic curve to adjusted Arriaga estimates from the 2002 and 2012 PHCs using **TFRLGST.XLS** (Table 2.1). The logistic curve is well-suited to modelling fertility decline for most regions in Tanzania because it allows for a relatively slow initial decline in TFR, followed by a steeper decline, finally, by a slower decline as TFR approaches a lower asymptote, or bound (set at 2 births per woman for all areas).

Table 2.1: Fertility Assumptions for Tanzania, Tanzania Mainland and Tanzania Zanzibar: 2012 – 2035

Year	Tanzania	Tanzania Mainland	Tanzania Zanzibar
2012	5.40	5.40	4.99
2013	5.35	5.35	4.83
2014	5.29	5.29	4.68
2015	5.24	5.24	4.52
2016	5.19	5.19	4.37

2025	4.68	4.68	3.15
2026	4.62	4.62	3.04
2027	4.56	4.56	2.95
2028	4.50	4.50	2.86
2029	4.44	4.44	2.78
2030	4.38	4.38	2.70
2031	4.32	4.32	2.63
2032	4.26	4.26	2.57
2033	4.20	4.20	2.51
2034	4.14	4.14	2.46
2035	4.08	4.08	2.41

2.4 Mortality

2.4.1 Introduction

Population projections are affected by several factors including Infant Mortality Rate (IMR), Under Five Mortality Rate (U5MR), Crude Death Rate (CDR) and Life expectancy at birth (e_0). Application of any index depends mainly on the availability of information or the requirement of models to be used in the exercise. In all mortality indices, life expectancy at birth is considered to be more appropriate as an input for population projections.

2.4.2 Mortality Estimation

Assumed mortality levels and trends for 26 regions of Tanzania Mainland were derived using a four-step process. However, a three-step process was used for five regions of Tanzania Zanzibar. For Tanzania Mainland, mortality (probabilities of dying at ages 0 and 1 to 4, 1q0 and 4q1) were taken from the 2004, 2010 and 2015/16 TDHSs. AIDS-specific mortality was estimated using historical demographic data from censuses and TDHSs plus epidemiological modeling based on HIV sentinel surveillance and population survey data (the AIM and DemProj modules in Spectrum, version 5.563, assuming United Nations General model mortality²). Male and female probabilities of dying in childhood from the TDHSs were converted to age-specific central death rates ($M(x)$ s). Adjusted AIDS $M(x)$ s³ were subtracted to get deaths without-AIDS $M(x)$ s, and then were reconverted into probabilities of dying, and there after were converted into life table survivors to exact age 5 (l_5), assuming Coale-Demeny North model mortality⁴. The remainder of life table without-AIDS corresponding to each l_5 was calculated, using North model mortality, associated life expectancies at birth (e_0) were extracted, and sex-specific trends in e_0 were calculated by fitting a logistic curve to the without-AIDS e_0 s. Lower asymptotes of 25 years were assumed for both males and females; upper asymptotes of 82.56 and 88.40 years were assumed for males and females respectively.

Age-and-sex-specific $M(x)$ s without-AIDS were calculated for each year from 2012 through 2035 using 2012 life table $M(x)$ s, a set of $M(x)$ s corresponding the life expectancy at birth (e_0) values of 82.56 and 88.40 years for males and females respectively, and the Rural-Urban Projections program (RUP).

Exponential growth rates based on adjusted age-and-sex-specific $M(x)$ s for years 2002 and 2012 were calculated. The negative growth rates were used to calculate declining age-specific AIDS $M(x)$ s for each year from 2013 through 2035. These age-sex-specific AIDS $M(x)$ s were added to without-AIDS $M(x)$ s to yield with-AIDS $M(x)$ s for each year of the projection horizon.

Life tables without-AIDS for regions were derived using published life table probabilities indirectly estimated from child survivorship data from the 2012 PHC⁵. Region-and-sex-specific life

² Spectrum and its modules (Avenir Health 2016) are documented online. For United Nations General and other model life table systems, see United Nations (1982).

³ Adjusted AIDS $m(x)$ s were calculated from Spectrum output, converting mortality spanning two calendar years into calendar-year (or Lexis square) deaths and mortality. The adjustment also corrected for errors at age zero, age 4, and at ages 80+. The workbook used to extract the adjusted AIDS mortality from Spectrum ver. 5.441 output was written by Peter Johnson, U.S. Census Bureau.

⁴ Coale and Demeny (1966). See, also, Arriaga (1994: 109).

⁵ Brass' child survivorship technique was used in establishing levels of under-5 mortality. See Brass and others (1968), Palloni and Heligman (1985), United Nations (1983: 73-80).

expectancies at birth were projected to 2035 as a group, with each regional life expectancy at birth (e_0) following the e_0 trend of the Tanzania Mainland⁶. Age-and-sex-specific $M(x)$ s without-AIDS were calculated for each year from 2013 to 2035 using the 2012 $M(x)$ pattern, a set of $M(x)$ s corresponding the e_0 values of 82.56 and 88.40 years, and the RUP program.

Regional AIDS $M(x)$ s were derived by adjusting Tanzania Mainland AIDS $M(x)$ s upward or downward by the ratio of regional male and female HIV prevalence to Tanzania Mainland male and female HIV prevalence. This assumes that HIV prevalence is a rough proxy for mortality with AIDS. Although the assumption is weak, it provides acceptable working estimates of age-specific mortality with AIDS which is not available from either sentinel surveillance or population-based surveys.

The process for calculating mortality in Tanzania Zanzibar was simpler because it was without AIDS. Life tables for Tanzania Zanzibar as a whole were constructed using TDHS under-5 mortality and North model mortality at ages 5 and above. Tanzania Zanzibar regional mortality was indirectly estimated using child survivorship data from the 2002 and 2012 PHCs to estimate under-5 mortality and North model mortality to estimate $M(x)$ series at ages 5 and above. Indirect estimation for both under-5 and ages 5 and above was accepted because this procedure yielded plausible estimates of under-5 mortality as well as plausible life expectancies at birth.

The decision to calculate without AIDS mortality was based on the following:

- i. The AIDS epidemic in Tanzania Zanzibar is “concentrated” among well-defined sub-populations (e.g., drug users and sex workers) while the epidemic on Tanzania Mainland is “generalized” – more widespread. The epidemiologic models used to estimate age-sex distributions of those infected, those with AIDS, and those dying of AIDS differ between the two types of epidemics;
- ii. Prevalence level in Tanzania Zanzibar is equivalent to a generalized epidemic with overall prevalence of about one percent. However, the number of AIDS deaths in Tanzania Zanzibar is very small; and
- iii. Tanzania Zanzibar does not have approved ANC sentinel surveillance site data that can be used for epidemiological modeling.

Assumed life expectancies at birth for Tanzania Mainland and Tanzania Zanzibar are shown in Table 2.2.

⁶ The Census Bureau’s Subnational Projections Toolkit workbook PROJe032.xls was used.

2.4.3 Assumptions

Assumptions underlying mortality projections have been made in the context of reported stabilizing trend and expected further decline in HIV prevalence, increasing availability of numerous HIV prevention measures and increased access to Anti-Retroviral (ARV) drugs. These developments are expected to favourably alter the HIV and AIDS epidemiological profile of Tanzania, as infection rates will reduce, while more HIV-infected persons will be living longer. In view of this, drawing from declining mortality rate and improvements made in the pre-HIV and AIDS era, life expectancy at birth is expected to improve, albeit modestly during the projection period.

Assumptions in the Context of AIDS

The life expectancy at birth and the adjusted age-specific death rates for the base year were derived from the 2012 PHC data for males and females using LTPOPDTM spreadsheet in population analysis spreadsheets. Determination of the rate of improvement in life expectancy at birth during the projection period (2013-2035) was guided by analysis of the rate of improvement during the pre-HIV and AIDS era. The set of age-specific death rates derived from the 2012 PHC data was used as a baseline input because it reflects the mortality effect of AIDS on the population and is consistent with the base year life expectancy at birth.

Projection of the age-specific death rates corresponding to each projected life expectancy at birth was done using the base year age-specific death rates and the MATCH spreadsheet in MORTPAK package. The purpose of this procedure is to maintain Tanzania's empirical age pattern of mortality. The empirical and projected age-specific schedules of mortality were then keyed into RUP program, and the Coale-Demeny North separation factors specified to generate a series of life tables were used in projecting the population.

Despite a large amount of available Census data for mortality estimates, generally in the developing world, it is known that mortality information derived from censuses has all along been inadequate. The most reliable data for mortality estimates are obtained from registration of deaths for countries where vital registration systems are in place. However, Tanzania, like many countries in sub-Saharan Africa, does not have a comprehensive vital registration system that provides quality information for reliable mortality estimates. Errors in the number of deaths reported through the 2012 PHC in Tanzania were due to:

- i. Reluctance of respondents to talk about recent dead relatives;
- ii. Inability of respondents to remember dates of deaths;
- iii. Mis-interpretation of the past one year to be the same as the previous calendar year; and
- iv. Break-up of a household as a result of death of the head of the household.

To get desired mortality levels, the quality of data was evaluated using the Growth Balance Technique and the Preston-Coale Technique. The growth balance technique estimates the completeness of reported deaths of age 5 and over by comparing the age distribution of deaths to get the age distribution of population. It provides information on the quality of death data and allows an adjustment in cases where the population meets the assumptions. For the 2012 PHC, adjustment of the data was done by using the LTPOPDTH.XLS spreadsheet for males and females to generate central mortality rates and life expectancy at birth. Life expectancy at birth was projected for the years from 2013 to 2035 using E0PRJ.XLS spreadsheet. The mortality assumptions for Tanzania, Tanzania Mainland and Tanzania Zanzibar are summarized in the following table.

Table 2.2: Mortality Assumptions: Life Expectancy at Birth for Tanzania, Tanzania Mainland and Tanzania Zanzibar: 2012 – 2035

Year	Tanzania		Tanzania Mainland		Tanzania Zanzibar	
	Male	Female	Male	Female	Male	Female
2012	59.67	63.61	59.57	63.51	63.25	67.00
2013	60.51	64.83	60.42	64.73	63.59	67.64
2014	61.35	66.03	61.27	65.92	63.93	68.27
2015	62.17	67.20	62.10	67.08	64.27	68.88
2016	62.98	68.34	62.92	68.21	64.61	69.49
2017	63.77	69.45	63.72	69.32	64.94	70.08
2018	64.54	70.52	64.50	70.38	65.27	70.67
2019	65.30	71.55	65.26	71.41	65.59	71.24
2020	66.03	72.54	66.01	72.40	65.91	71.80
2021	66.75	73.49	66.74	73.35	66.23	72.35
2022	67.45	74.41	67.44	74.26	66.54	72.89
2023	68.13	75.28	68.13	75.14	66.85	73.41
2024	68.79	76.11	68.79	75.97	67.16	73.92
2025	69.42	76.90	69.44	76.76	67.46	74.42
2026	70.04	77.65	70.06	77.51	67.76	74.91
2027	70.63	78.36	70.66	78.22	68.06	75.39
2028	71.21	79.04	71.24	78.90	68.35	75.85
2029	71.76	79.67	71.80	79.54	68.63	76.30
2030	72.29	80.27	72.33	80.14	68.92	76.73
2031	72.80	80.83	72.85	80.70	69.19	77.16
2032	73.29	81.36	73.34	81.24	69.47	77.57
2033	73.76	81.86	73.81	81.74	69.74	77.97
2034	74.21	82.32	74.27	82.20	70.01	78.36
2035	74.65	82.76	74.70	82.64	70.27	78.74

2.5 Migration

2.5.1 Introduction

Inclusion of migration assumptions in population projections is important because it is one of the major components of population dynamics. There are two types of migration data that are considered in population projections (i.e. internal migration and international migration).

Internal migration data are used in regional or district population projections because they do not change the total population of the country. On the other hand, international migration data are used at national level population projections because they involve crossing national boundaries that change the population of the respective countries.

Generally, migration data from population censuses are obtained from questions on the place of birth and residence. When data on place of birth and residence are lacking, data of foreign-born population may be valuable for measuring migration. Whereas the measurement of the volume of immigrants can be obtained from census data, the volume of emigrants cannot be captured in the census. Due to lack of emigration data in the census, data from Immigration Department of the Ministry of Home Affairs were used for the projection.

2.5.1 Internal Migration Assumptions

Internal migration for Tanzania, Tanzania Mainland, Tanzania Zanzibar and regions were derived from the 2012 PHC question on place of residence 12 months prior to the census. Age patterns of in-migrants and out-migrants were estimated in four steps as follows: -

- i. Denominator populations for the 12 months preceding the census were calculated from tabulated population of migrants and non-migrants, excluding residents previously residing abroad by single years of age in 2011 and 2012. Average populations were used to place the denominator populations six months prior to the census. Age-and-sex-specific migration rates for five-year age groups and for population under age 5 for which data were available were calculated using the average regional populations in 2011 and 2012 as denominators. Five-year migration rates rather than single-year rates were calculated because single-year rates were too erratic.
- ii. A cubic spline function was used to extrapolate migration rates to age zero and to interpolate from five-year to single-year average rates. The resulting single-year migration rates were much smoother than the migration rates calculated from the census raw data, but they still exhibited unacceptable undulations beyond 15 years to mid-twenties in some

regions. Rates were summed up to generate what Rogers and Castro (1981) call a migraproduction rate (analogous to a total fertility rate, but summing single-age migration rates for all ages) to age 80⁷. The single-age migration rates to age 80 were then normalized by dividing each age-specific migration rate by the sex-specific in- or out-migration migraproduction rate.

- iii. Seven-parameter Rogers-Castro curves were fitted to the smoothed-and-normalized age-specific migration rates. The seven-parameter variant of the 13-parameter Rogers-Castro function is well-suited for modeling age patterns of migration lacking a pronounced retirement peak. That said, each region-sex-and-migration flow-specific age pattern was inspected after cubic-spline fitting and after re-fitting with the Rogers-Castro function to check whether a retirement peak was obvious, but no case was found. Tables 2.3 and 2.4 elaborate the formula used.

Table 2.3: The 13-Parameter Rogers-Castro Multi-Exponential Function

$M(x) = a1 * \exp(-\alpha1 * x)$	Pre-labour force segment of the curve
$+a2 * \exp\{-\alpha2 * (x - \mu2) - \exp[-\lambda2 * (x - \mu2)]\}$	Labour force peak
$+a3 * \exp\{-\alpha3 * (x - \mu3) - \exp[-\lambda3 * (x - \mu3)]\}$	Retirement peak
$+a4 * \exp(\lambda4 * x)$	Post-retirement segment
$+c$	Underlying level of migration

Table 2.4: The 7-Parameter Rogers-Castro Multi-Exponential Function used to Fit in- and Out-Migration Rates from the 2012 PHC

$M(x) = a1 * \exp(-\alpha1 * x)$	Pre-labor force segment of the curve
$+a2 * \exp\{-\alpha2 * (x - \mu2) - \exp[-\lambda2 * (x - \mu2)]\}$	Labor force peak
$+c$	Underlying level of migration

- iv. Each fitted Rogers-Castro function was compared with the cubic spline fitting, where male and female fitted rates were compared especially under age 10. If the cubic spline is fitted, normalized census rates appeared as good at the youngest ages as the Rogers-Castro predicted values. Whereas the location of the census labour force peak differed slightly from the Rogers-Castro model's labour force peak model age, the cubic spline-fitted census rates were retained for that part of the age range and the Rogers-Castro predicted values were accepted for the post-labour force peak ages.

⁷ Rogers, Little and Raymer (2010:27-28) describe the process of fitting age patterns of migration using the process adopted for the 2012 PHC.

Looking at the age pattern of migration were found to be common because of misreporting at older ages. If male and female rates at the youngest ages were different, or if rates for one sex at all ages were much larger than those for the other sex, substitution to make the sex-specific rates comparable was considered. For the majority of regions and migration flows, a combination of census and Rogers-Castro rates provided an acceptable age pattern of migration.

Finally, the resulting four set of rates for each region for both male and female in- and out-migration rates were converted to migrant numbers by multiplying single-age rates to adjusted single-age population in 2012, using RUP. For all regions, it was assumed that the number of migrants would remain constant over the projection period.

2.5.1 International Migration Assumptions

Net international migration, other than refugee movements, was considered negligible. This does not mean that international migration was ignored (and, indeed, census tabulations of residence 12 months prior to the 2012 PHC indicates some in-migration to most regions). However, the census provides no direct estimates of out-migration to counterbalance the reported in-migration. Estimates of in-migration from the census are small and indirect procedures for estimating net intercensal international migration risk confounding migration with differences in census undercount. It was, therefore, decided to avoid possible introduction of additional error associated with mis-specification of non-refugee international migration and to limit projection assumptions to, instead, refugee flows.

Limited refugee data were available from the United Nations High Commission for Refugees up to the end of 2015 and from the Immigration Department of the Ministry of Home Affairs up to the end of 2016⁸. Annual arrivals and departures from the Ministry were used to estimate annual refugee flows up to 2016, and as the basis for assuming refugee trend inflows up to 2020. The age-sex distribution of refugees was based on age-sex distribution of the number of refugees in the country in 2015. Refugee flows into or out of Tanzania were allocated to Kigoma, Kagera and Tabora regions based on the distribution of refugees in these regions. The process of receiving and vetting of new arrivals from neighbouring countries, and the movement of refugees from Kigoma region camps to other areas over time was considered.

The National projection as the sum of Tanzania Mainland and Tanzania Zanzibar projections, controlled regional projections to ensure consistency with Tanzania Mainland and Zanzibar cohort-component projections. The projections for Tanzania Mainland and Tanzania Zanzibar were

⁸ UNHCR (2014, 2015, 2017), Ministry of Home Affairs (2017).

computed to form single-age-and-sex distributions on births and deathsmeasures, internal and international migrants for each year of the projection⁹.

The Tanzania Mainland projection was used as a control for the 26 Tanzania Mainland regional projections and Tanzania Zanzibar was used as a control for the five Tanzania Zanzibar regional projections. Projected regional populations in single years of age and by sex were adjusted to the higher area control projected population using progressive rounding to eliminate any differences. Regional births, deaths, and internal migrants were aligned to match the higher area births, deaths, and international migrants, though the process for international migrants is trivial. Net internal migration across regions was adjusted to be zero for each age-sex group in each year by the same adjustment process¹⁰.

2.6 HIV/AIDS Assumptions

2.6.1 Introduction

HIV/AIDS cases were clinically diagnosed and reported for the first time in 1983 in Kagera Region. By 1986, all regions of Tanzania Mainland had reported HIV/AIDS cases. According to the HIV and Malaria Survey 2011/2012, 5 percent of Tanzanian adults aged 15-49 are HIV-positive. The HIV prevalence is higher in urban areas than in rural areas (7 percent versus 4 percent), and is higher in Tanzania Mainland (5 percent) than in Tanzania Zanzibar (1 percent).

2.6.2 HIV/AIDs Assumptions

Assumed mortality levels and trends for Tanzania Mainland and 26 regions of Tanzania Mainland were derived using a four-step process while a three-step process was used for Tanzania Zanzibar and its five regions.

In Tanzania Mainland, mortality (probabilities of dying at ages 0 (${}_1q_0$) and 1 to 4, (${}_4q_1$)) were taken from the 2004-05, 2010 and 2015-16 TDHSs. AIDS-specific mortality was estimated using historical demographic data (censuses and TDHSs) plus epidemiological modeling based on HIV sentinel surveillance and population survey data (the AIM and DemProj modules in Spectrum, version 5.441, assuming United Nations General model mortality¹¹). Male and female probabilities of dying in childhood from the TDHSs were converted to age-specific central death rates ($M(x)$ s)

⁹ The U.S. Census Bureau program RUPAGG was used for the aggregation of the Mainland and Zanzibar projections.

¹⁰ The process was implemented using the U.S. Census Bureau's Subnational Projections Toolkit workbook RUPSubAdj.xlsx.

¹¹ Spectrum and its modules (Avenir Health 2016) are documented online. For United Nations General and other model life table systems, see United Nations (1982).

and adjusted AIDS $M(x)$ s¹² were subtracted to get without-AIDS $M(x)$ s. These were reconverted into probabilities of dying and were then converted into life table survivors to exact age 5 (l5), using Coale-Demeny North model mortality¹³. The remainder of a “without-AIDS” life table corresponding to each l5 was calculated, again using North model mortality, associated life expectancies at birth (e_0) were extracted, and sex-specific trends in e_0 were calculated by fitting a logistic curve to the without-AIDS e_0 s. Lower asymptotes of 25 years were assumed for both males and females and upper asymptotes of 82.56 and 88.40 years were assumed for males and females, respectively.

Next, without-AIDS age-and-sex-specific $M(x)$ s were calculated for each year from 2012 through 2035 using 2012 life table $M(x)$ s, a set of $M(x)$ s corresponding the e_0 values of 82.56 and 88.40 years, and the U.S. Census Bureau’s Rural-urban Projections program (RUP).

Next, exponential growth rates based on adjusted age-and-sex-specific $M(x)$ s for years 2007 and 2012 were calculated and these (negative) growth rates were used to calculate declining age-specific AIDS $M(x)$ s for each year from 2013 through 2035. These age-sex-specific AIDS $M(x)$ s were added to the without-AIDS $M(x)$ s to yield with-AIDS $M(x)$ s for each year of the projection horizon.

For Tanzania Mainland regions, without-AIDS life tables were derived the same way as the Tanzania Mainland life tables, but using published life table probabilities indirectly estimated from 2012 PHC¹⁴ child survivorship data. Regional life expectancies at birth were separately projected to 2035, with each regional e_0 following the e_0 trend of the Tanzania Mainland¹⁵. Without-AIDS age-and-sex-specific $M(x)$ s were calculated for each year from 2012 through 2035 using the 2012 $M(x)$ pattern, a set of $M(x)$ s corresponding the e_0 values of 82.56 and 88.40 years, and the RUP program.

Regional AIDS $M(x)$ s were derived by adjusting Tanzania Mainland AIDS $M(x)$ s upward or downward by the ratio of regional male and female HIV prevalence to Tanzania Mainland male and female HIV prevalence. This assumes that HIV prevalence is a rough proxy for AIDS mortality. The assumption is arguably weak, but provides acceptable working estimates of age-specific AIDS

¹² Adjusted AIDS $m(x)$ s were calculated from Spectrum output, converting mortality spanning two calendar years into calendar-year (or Lexis square) deaths and mortality. The adjustment also corrected for errors at age zero, age 4, and at ages 80+. The workbook used to extract the adjusted AIDS mortality from Spectrum ver. 5.441 output was written by Peter Johnson, U.S. Census Bureau.

¹³ Coale and Demeny (1966). See, also, Arriaga (1994: 109).

¹⁴ Brass’ child survivorship technique was used in establishing levels of under-5 mortality. See Brass and others (1968), Palloni and Heligman (1985), United Nations (1983: 73-80).

¹⁵ The Census Bureau’s Subnational Projections Toolkit workbook PROJe032.xls was used.

mortality unavailable from either sentinel surveillance or population-based surveys. Again, exponential growth rates based on adjusted age-and-sex-specific $M(x)$ s for years 2007 and 2012 were calculated and these (negative) growth rates were used to calculate declining age-specific AIDS $M(x)$ s for each year from 2012 through 2035. These age-sex-specific AIDS $M(x)$ s were added to the without-AIDS $M(x)$ s to yield with-AIDS $M(x)$ s for each year of the projection horizon. The with-AIDS $M(x)$ s were then used to project Tanzania Mainland and its regional populations forward from 2013 to 2035.

For Tanzania Zanzibar, the process was simpler because Tanzania Zanzibar mortality was not modeled first without-AIDS and then with-AIDS. Life tables for Tanzania Zanzibar as a whole were constructed using TDHS under-5 mortality and North model mortality at ages 5 and above. Tanzania Zanzibar regional mortality was indirectly estimated using child survivorship data from the 2002 and 2012 PHCs to estimate under-5 mortality and North model mortality to estimate the $M(x)$ series at ages 5 and above. Indirect estimation for both under-5 and ages 5 and above was accepted because this procedure yielded plausible estimates of under-5 mortality as well as plausible life expectancies at birth.

The decision to adopt a different procedure for Tanzania Zanzibar was made after considerable discussions. In the end, it was decided that the nature of the HIV/AIDS epidemic in Tanzania Zanzibar would not warrant treatment in the same way as for Tanzania Mainland, and a prudent approach to life table construction would be based on an assumption of no AIDS mortality. The decision was based on the following:

- i. The epidemic in Tanzania Zanzibar is “concentrated” among well-defined subpopulations (e.g., drug users and sex workers) while the epidemic on Tanzania Mainland is “generalized” – more widespread. The epidemiologic models used to estimate age-sex distributions of those infected, those with AIDS, and those dying of AIDS differ between the two types of epidemics;
- ii. Prevalence level in Tanzania Zanzibar is equivalent to a generalized epidemic with overall prevalence of about one percent. However, the number of AIDS deaths in Tanzania Zanzibar is small (about 50 to 60 per year in a population of about 1.3 million persons) and modeling the AIDS age-sex $M(x)$ pattern could introduce errors into an estimated life table already subject to both processing errors (associated with the imputation of characteristics to household deaths following the census) and estimation errors;

- iii. Tanzania Zanzibar has not yet approved ANC sentinel surveillance site data that can be used for epidemiological modeling; and
- iv. The decision to avoid explicit modeling of AIDS mortality for Tanzania Zanzibar is not to avoid recognizing the fact that there are AIDS deaths in Tanzania Zanzibar. The decision simply attempts to avoid modeling the AIDS mortality in a population where the basis for doing so is weak and the possible error to be introduced in doing so is not substantial.

Chapter Three

Projections

3.1 Introduction

Information presented in this chapter includes: projected total population by sex in single and five-year age groups as well as a summary of demographic indicators derived by using Spectrum Software.

3.2 Highlights of Population Projections Results

This section discusses all demographic indicators for midyear population between 2013 and 2035.

3.2.1 Population Growth

The projections show that the Tanzania population growth rate is expected to decrease from 3.1 percent in 2013 (with a population of 46,356,279) to 2.8 percent in 2035 (with a population of 89,204,781). The projected population growth rate for Tanzania Zanzibar is expected to decrease from 3.4 percent in 2013 to 1.9 percent in 2035. The projected population growth rates for Tanzania, Tanzania Mainland and Tanzania Zanzibar are shown in Table 3.1.

Table 3.1: Projected Population Growth Rates for Tanzania, Tanzania Mainland and Tanzania Zanzibar: 2013 – 2035

Year	Tanzania	Tanzania Mainland	Tanzania Zanzibar
2013	3.1	3.1	3.4
2014	3.1	3.1	3.3
2015	3.1	3.1	3.3
2016	3.2	3.2	3.2
2017	3.1	3.1	3.1
2018	3.1	3.1	2.9
2019	3.1	3.1	2.9
2020	3.1	3.1	2.8
2021	3.1	3.1	2.7
2022	3.0	3.1	2.6
2023	3.0	3.0	2.5
2024	3.0	3.0	2.4
2025	3.0	3.0	2.4
2026	3.0	3.0	2.3
2027	2.9	2.9	2.2
2028	2.9	2.9	2.2
2029	2.9	2.9	2.1
2030	2.9	2.9	2.1
2031	2.8	2.9	2.0
2032	2.8	2.8	2.0
2033	2.8	2.8	1.9
2034	2.8	2.8	1.9
2035	2.8	2.8	1.9

3.2.2 Life Expectancy at Birth

Life expectancy at birth for Tanzania is expected to increase from 62 years in 2013 to 74 years in 2035 for both sexes which is the same for Tanzania Mainland. Life expectancy at birth for males in Tanzania is expected to increase from 60 years in 2013 to 71 years in 2035 similar to that of Tanzania Mainland, while life expectancy at birth for females will increase from 64 years in 2013 to 77 years in 2035, also the same as Tanzania Mainland. Life expectancy at birth for Tanzania Zanzibar is expected to be slightly higher than that of Tanzania and Tanzania Mainland. For males, the life expectancy at birth is expected to increase from 64 years in 2013 to 70 years in 2035 while the life expectancy at birth for females is also expected to increase from 67 in 2013 to 77 years in 2035.

The projected life expectancy at birth for Tanzania, Tanzania Mainland and Tanzania Zanzibar are indicated in Table 3.2.

Table 3.2: Projected Life Expectancy at Birth for Tanzania, Tanzania Mainland and Tanzania Zanzibar: 2013 – 2035

Year	Tanzania			Tanzania Mainland			Tanzania Zanzibar

3.2.3 Infant Mortality Rate (IMR)

Infant mortality rate is one of the important mortality indicators that significantly affect population dynamics. Like any other mortality indicators, Infant Mortality Rate is defined as the number of infant deaths per 1,000 live births. This projection revealed that infant mortality rates in Tanzania are expected to decline during the projection horizon (2013 to 2035). The projections show that the Infant Mortality Rate is expected to decline from 42.8 infant deaths per 1,000 live births in 2013 to 13.4 infant deaths per 1,000 live births in 2035 for both sexes in Tanzania and Tanzania Mainland. For Tanzania Zanzibar, the Infant Mortality Rate is expected to decline from 38.4 infant deaths per 1,000 live births in 2013 to 12.5 deaths per 1000 live births in 2035. Table 3.3 shows the trends of declining Infant Mortality Rate.

Table 3.3: Projected Infant Mortality Rates for Tanzania, Tanzania Mainland and Tanzania Zanzibar: 2013 – 2035

Year	Tanzania	Tanzania Mainland	Tanzania Zanzibar
2013	42.8	42.9	38.4

2035	13.4	13.4	12.5

3.2.4 Total Fertility Rate (TFR)

Fertility is projected to decline in Tanzania during the projection period. The projected TFR at the beginning of the projection period is 5.3 children per woman in 2013 and is expected to decline to 3.4 children per woman in 2035. For Tanzania Zanzibar, the projected TFR at the beginning of the projection period is 4.9 children per woman in 2013 and is expected to reach 3.2 children per woman in 2035. As for Tanzania Mainland, the projected TFR is 5.3 children per woman in 2013 and 4.1 children per woman in 2035 (Table 3.4).

3.2.5 Thematic Maps on Selected Age Groups and Indicators for the Year 2025

The following maps contain some indicators that will be used to evaluate Vision 2025 development programmes.

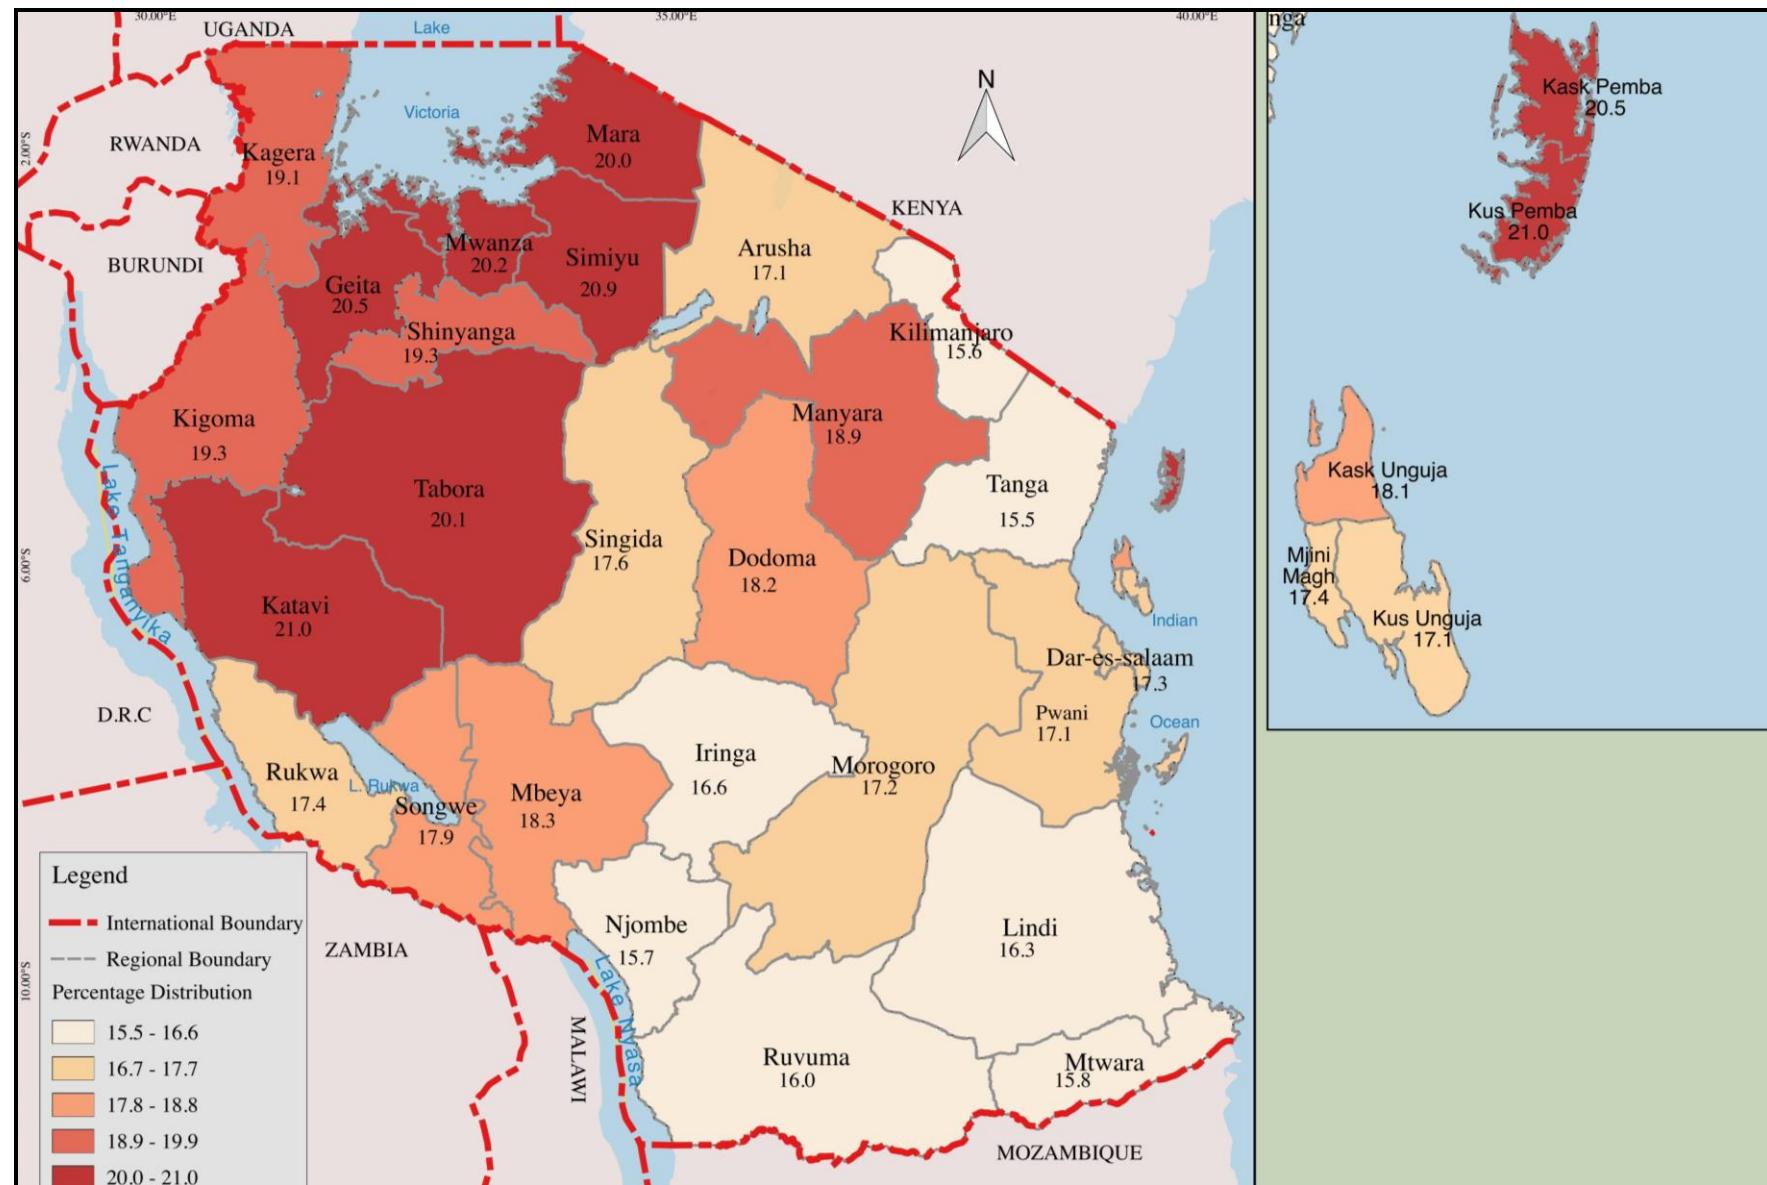

Map 3.1: Percentage Distribution of Children below Age One by Region: Population Projections 2025

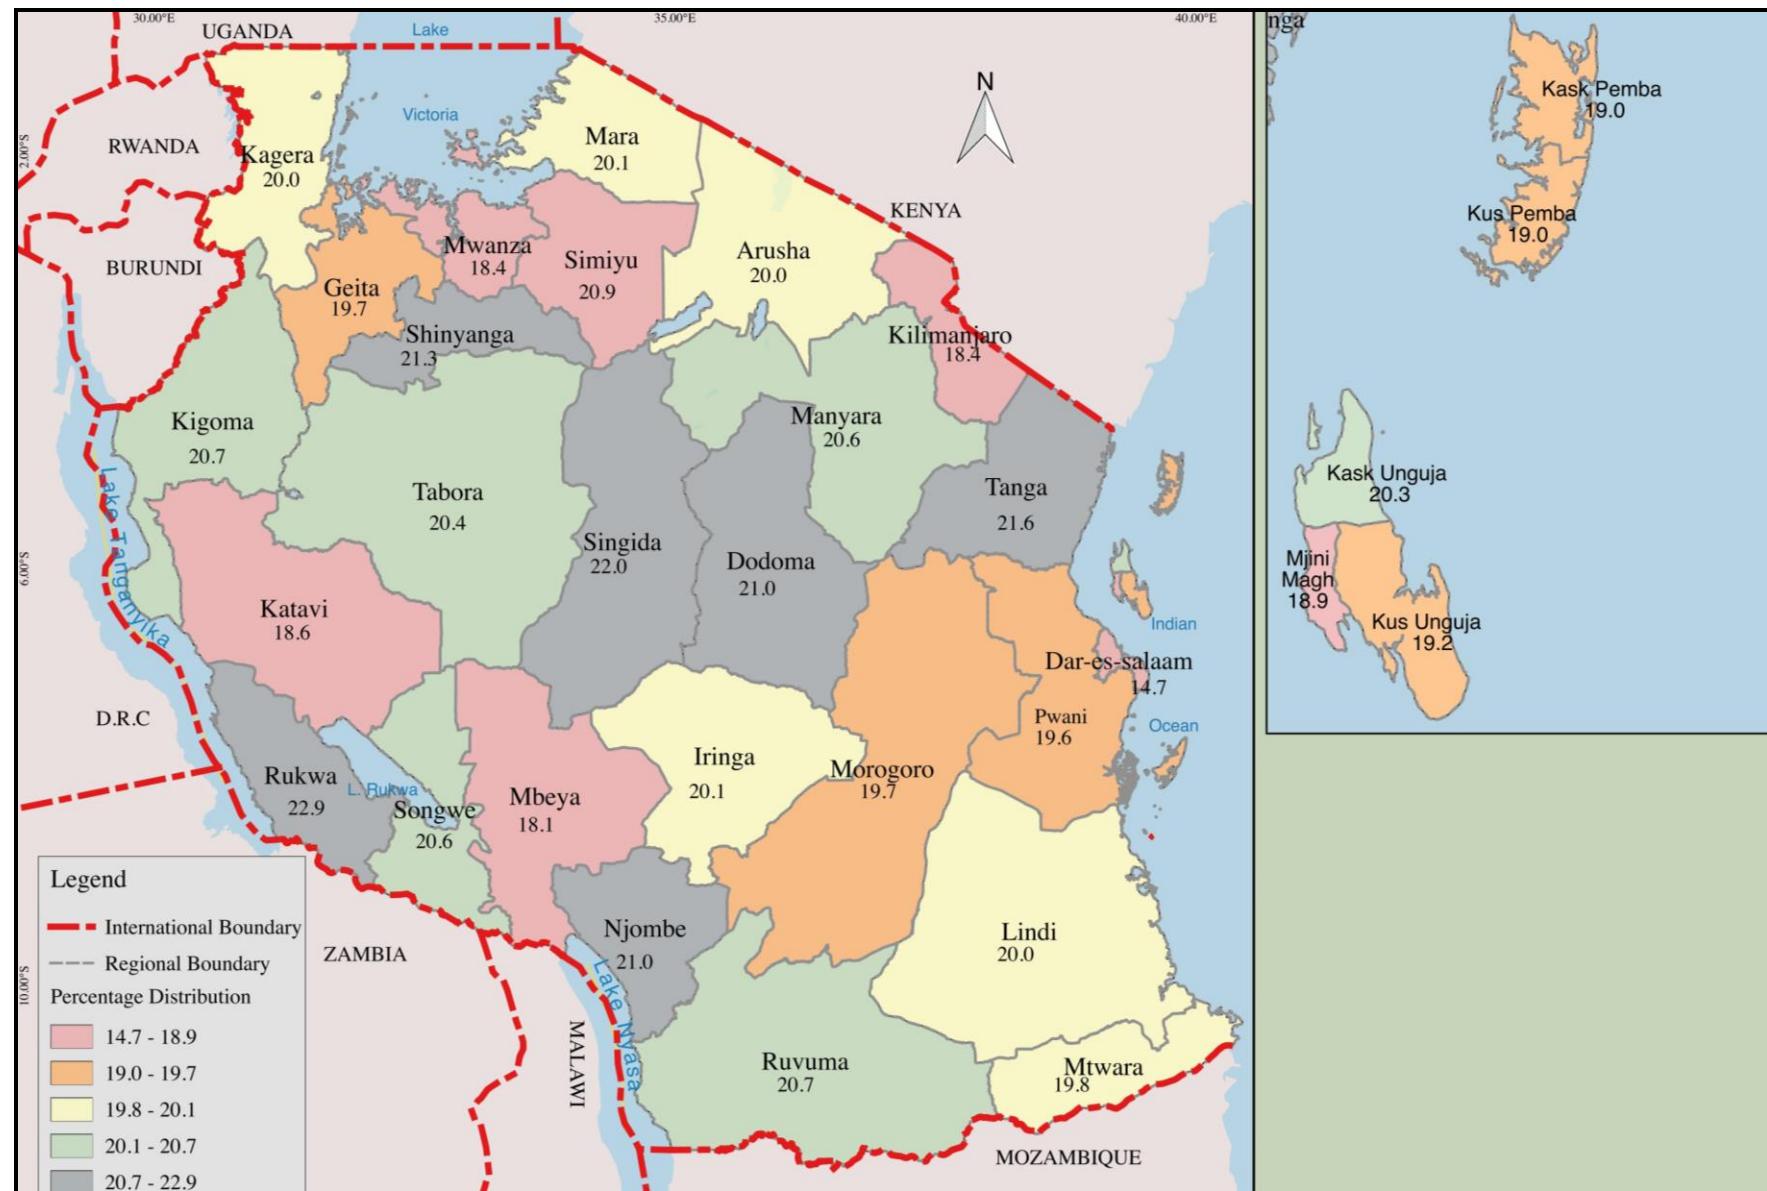

Map 3.2: Percentage Distribution of Children Aged 0 to 4 Years by Region: Population Projections 2025

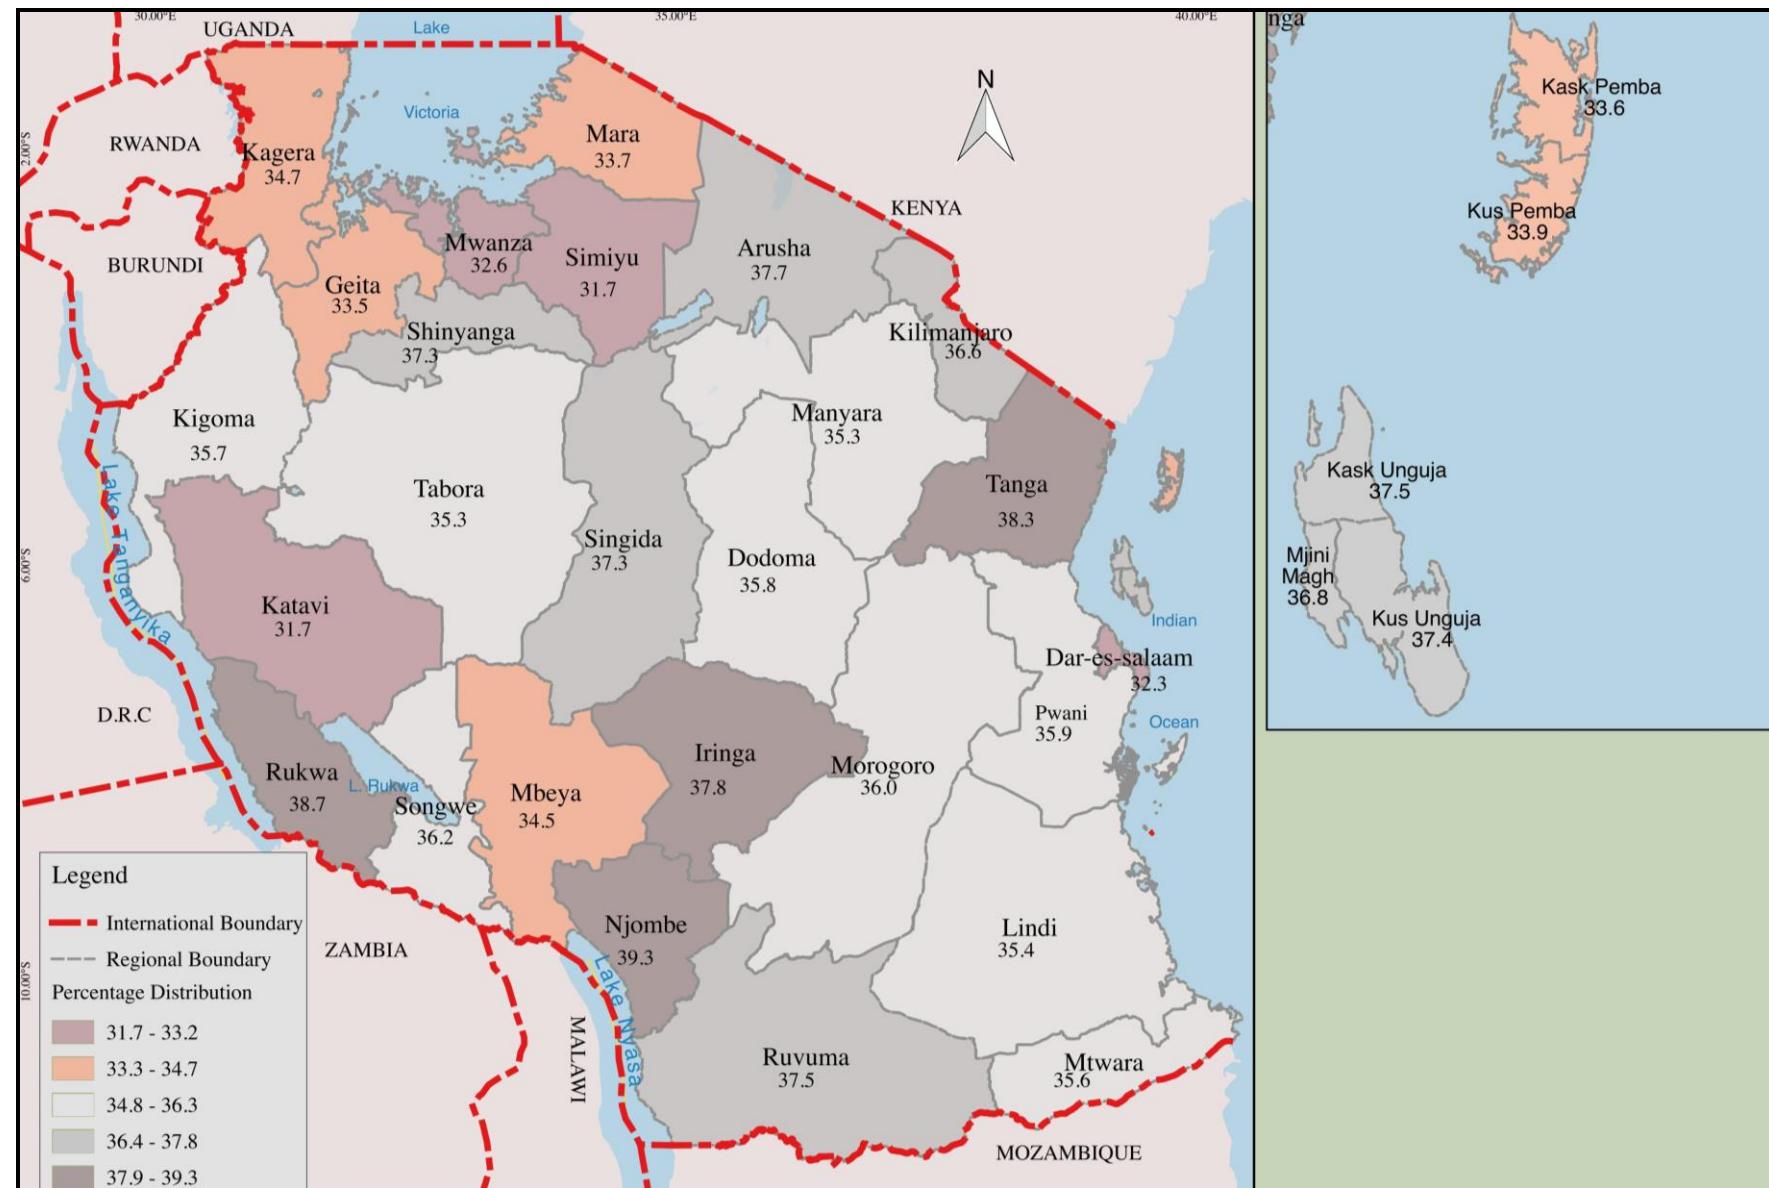

Map 3.3: Percentage Distribution of Population Aged 7 to 13 Years by Region: Population Projections 2025

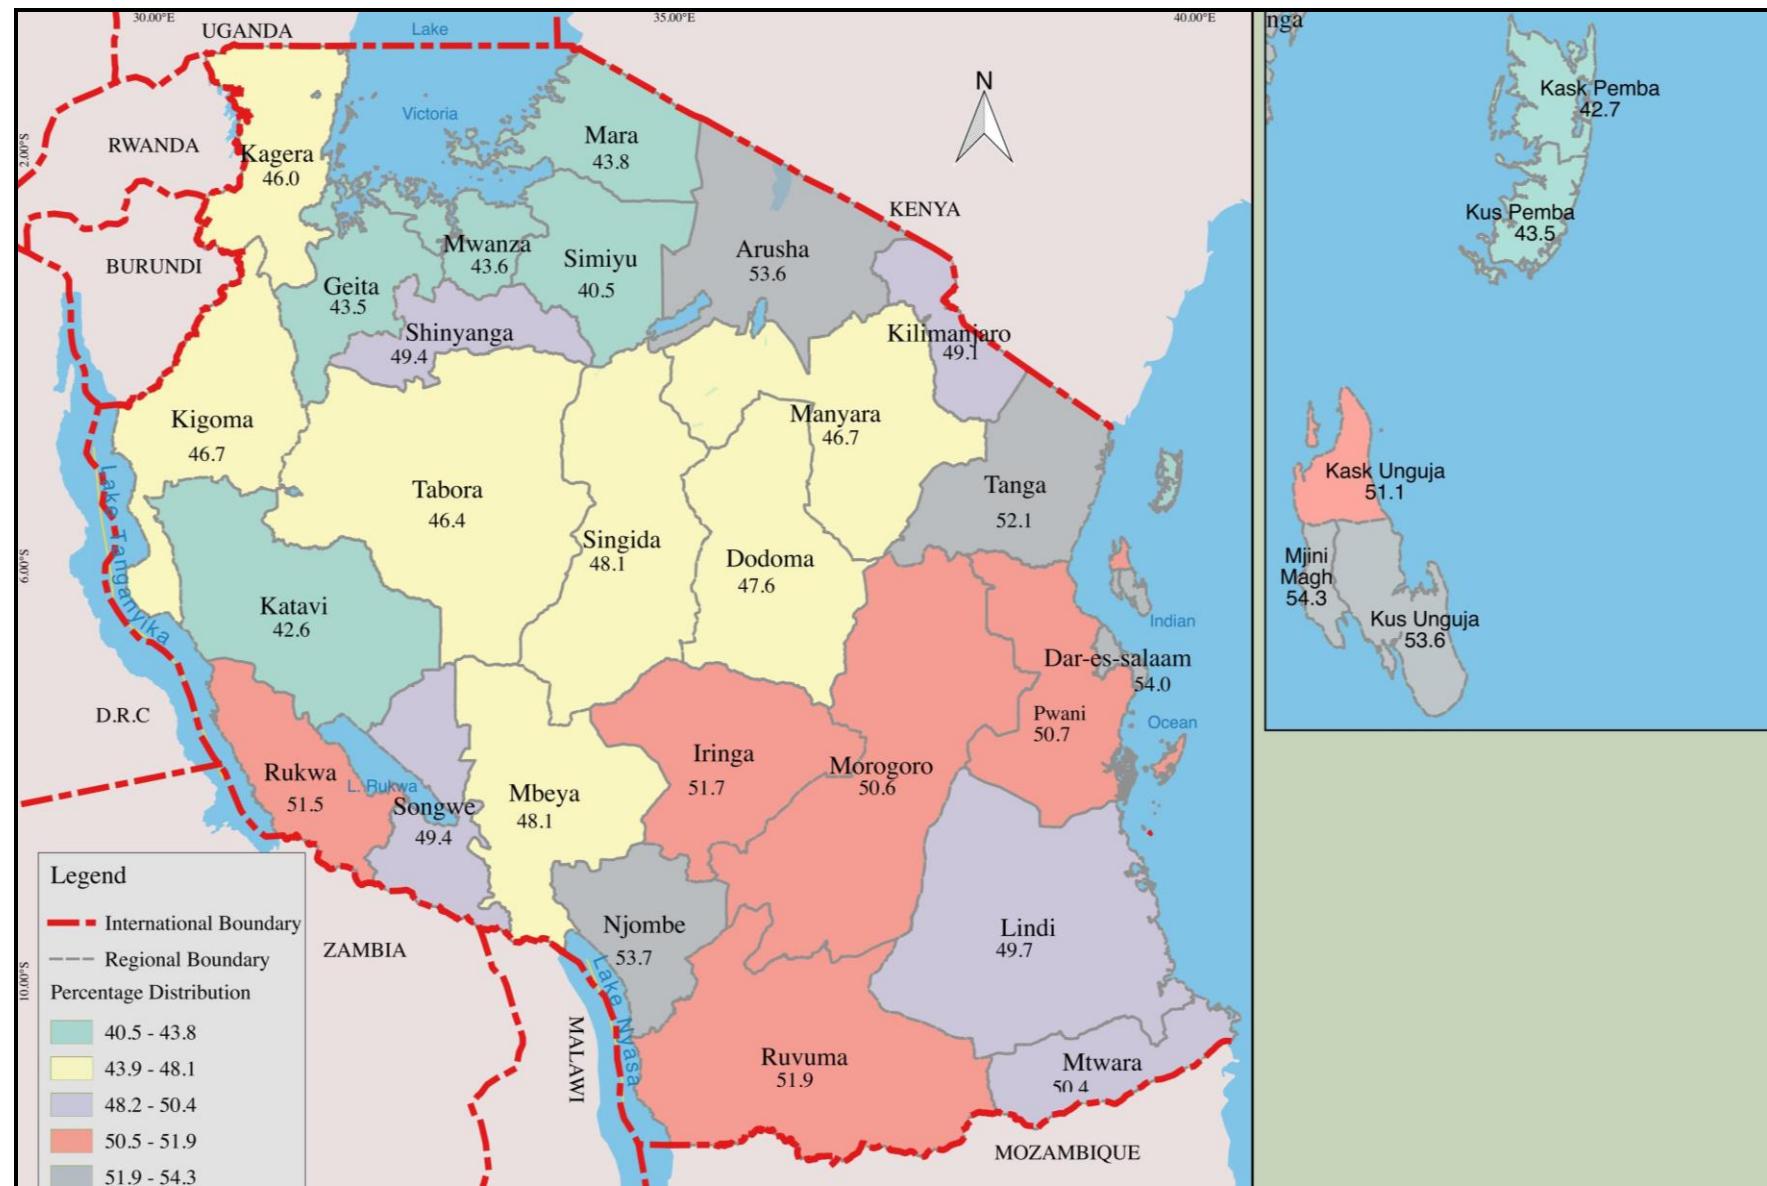

Map 3.4: Percentage Distribution of Population Aged 15 to 24 Years by Region: Population Projections 2025

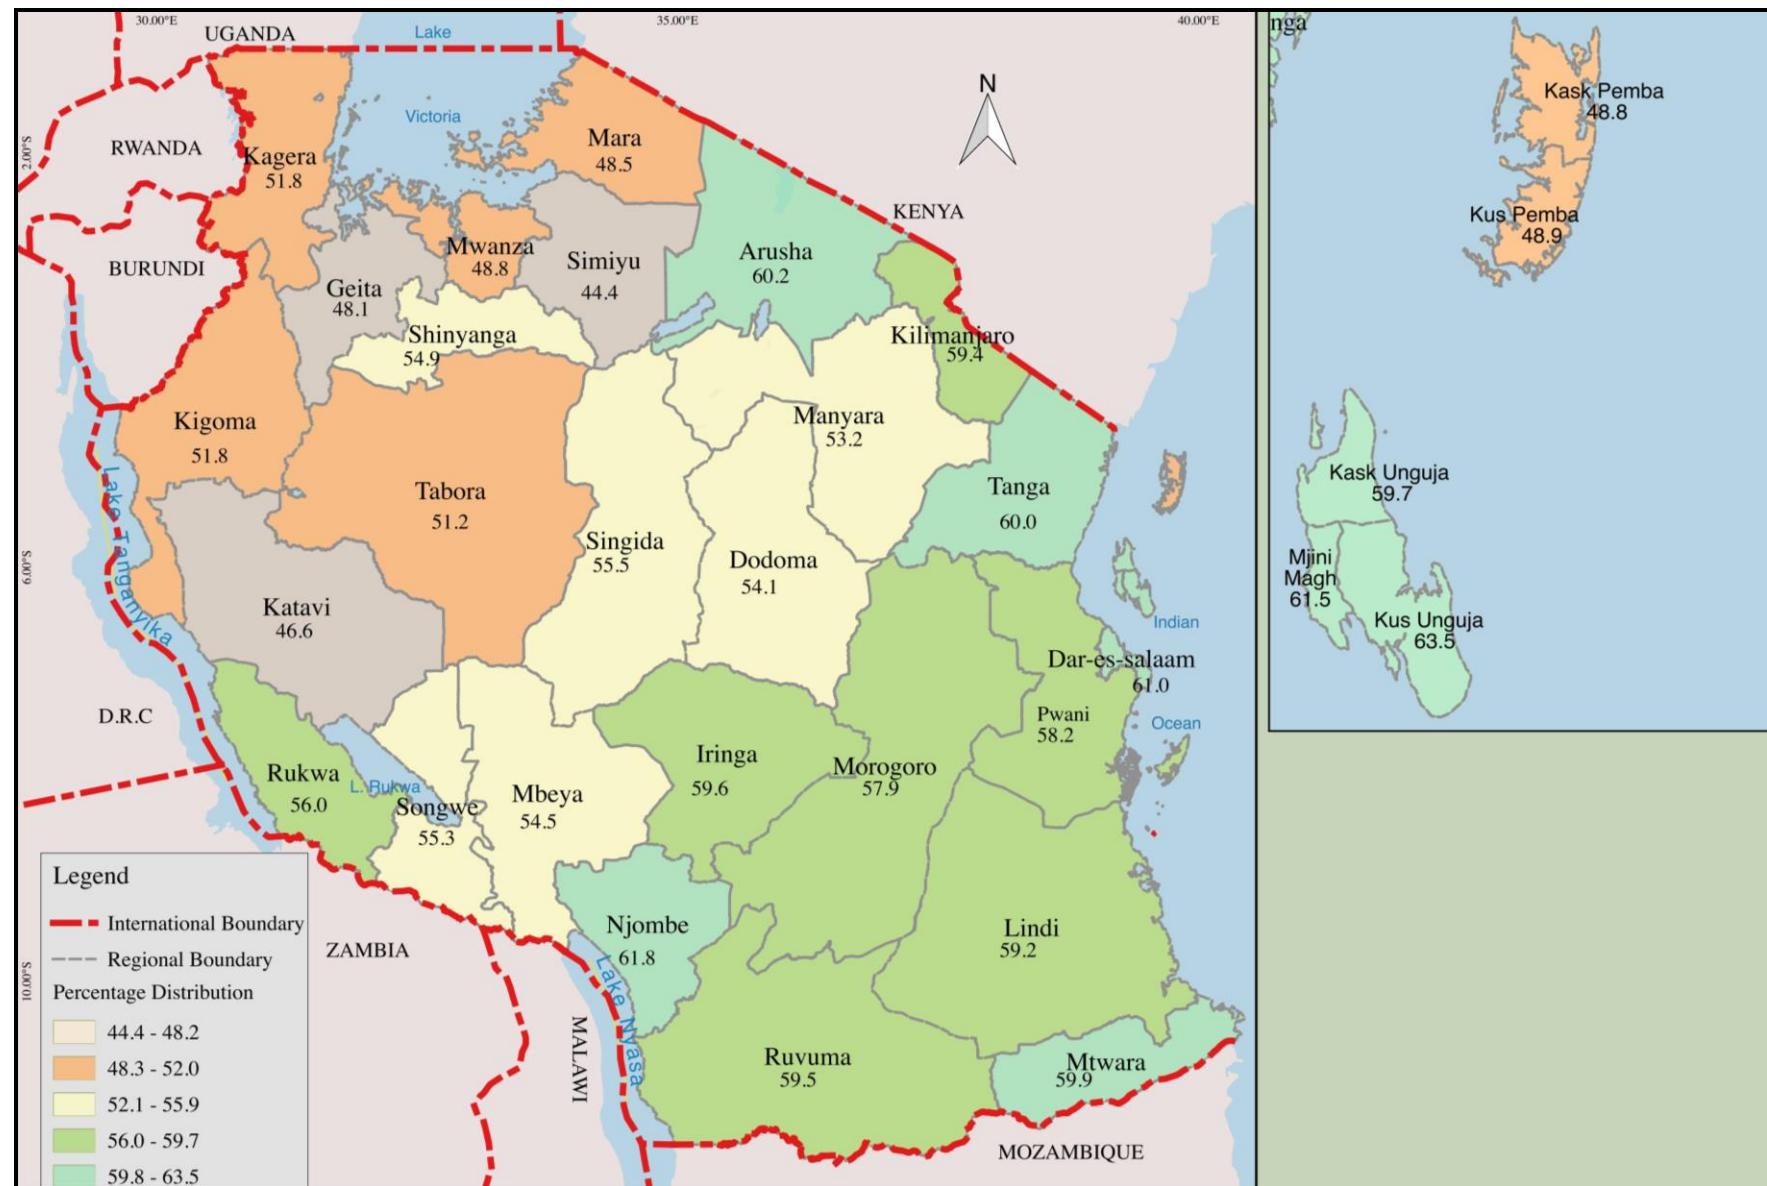

Map 3.5: Percentage Distribution of Population Aged 15 to 35 Years by Region: Population Projections 2025

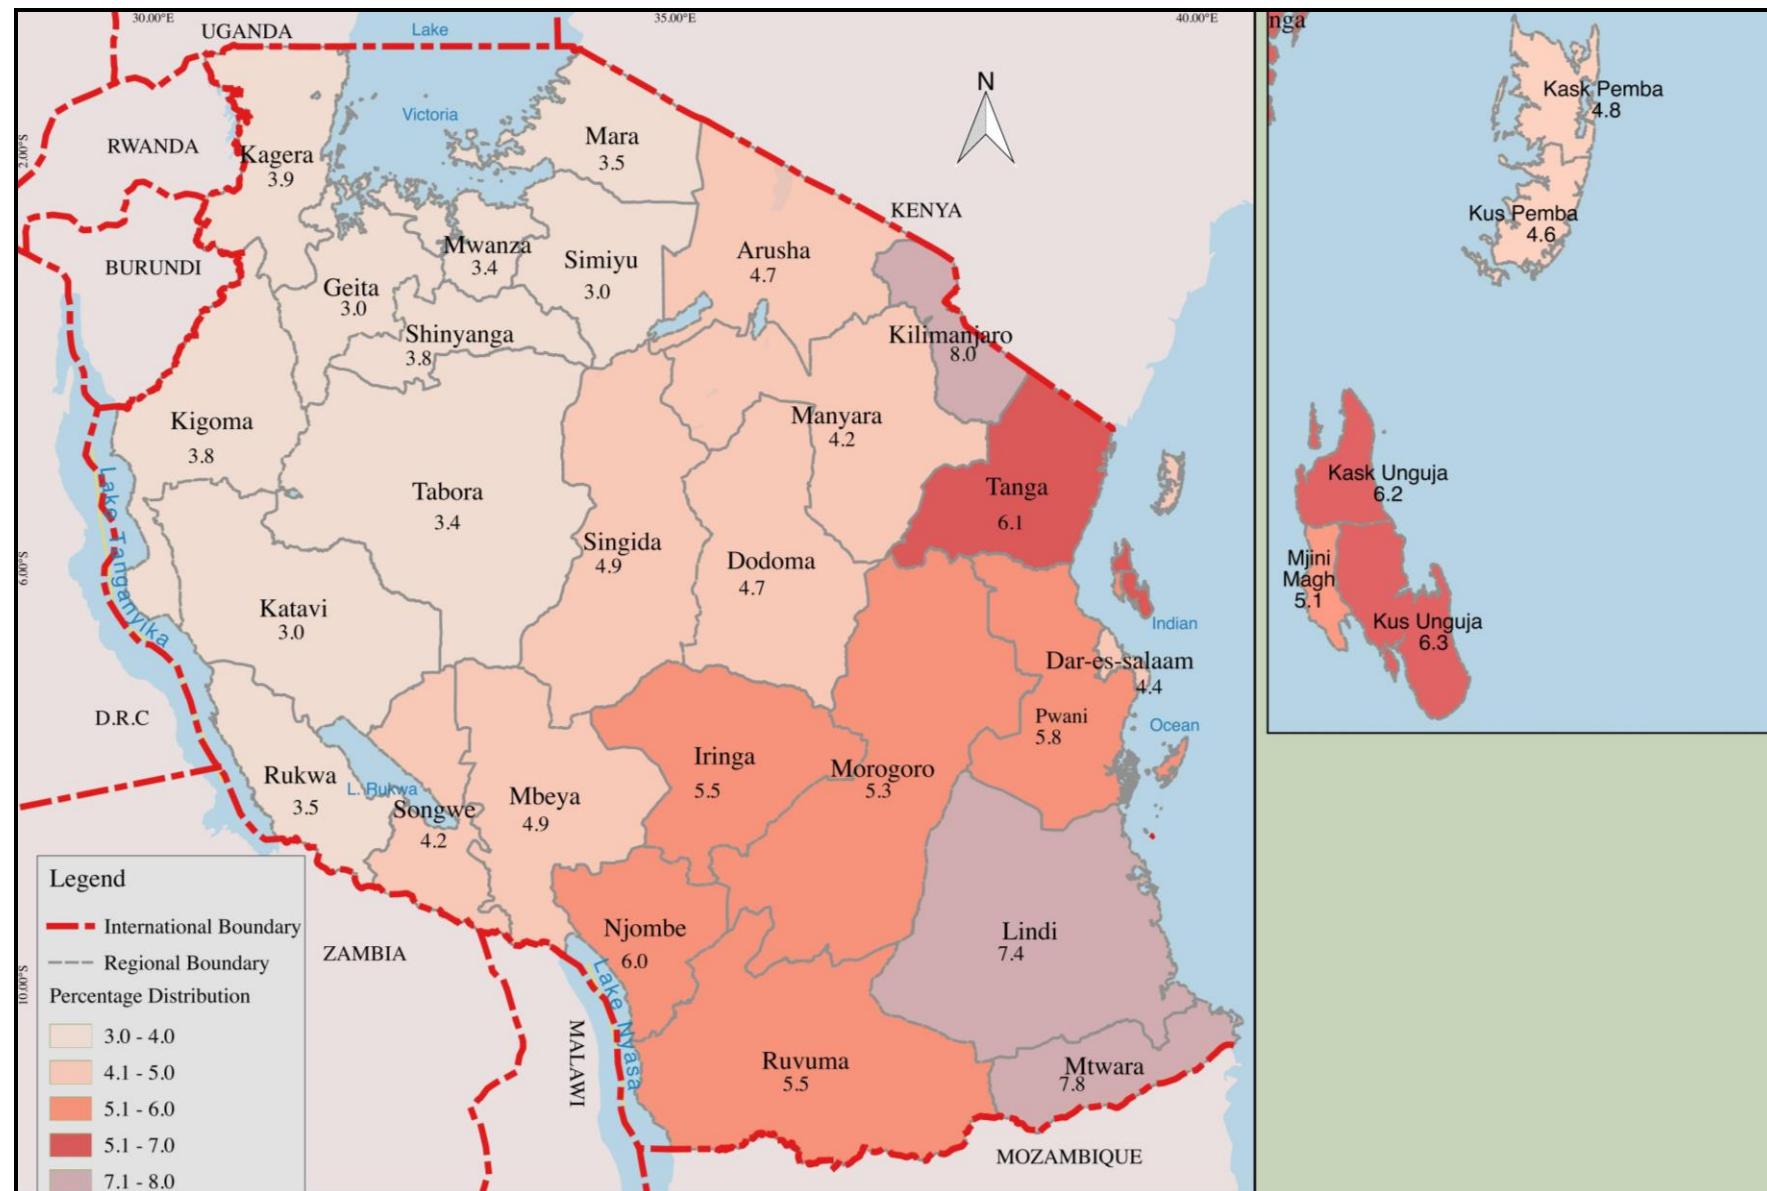

Map 3.6: Percentage Distribution of Female Population Aged 15 to 49 Years by Region: Population Projections 2025

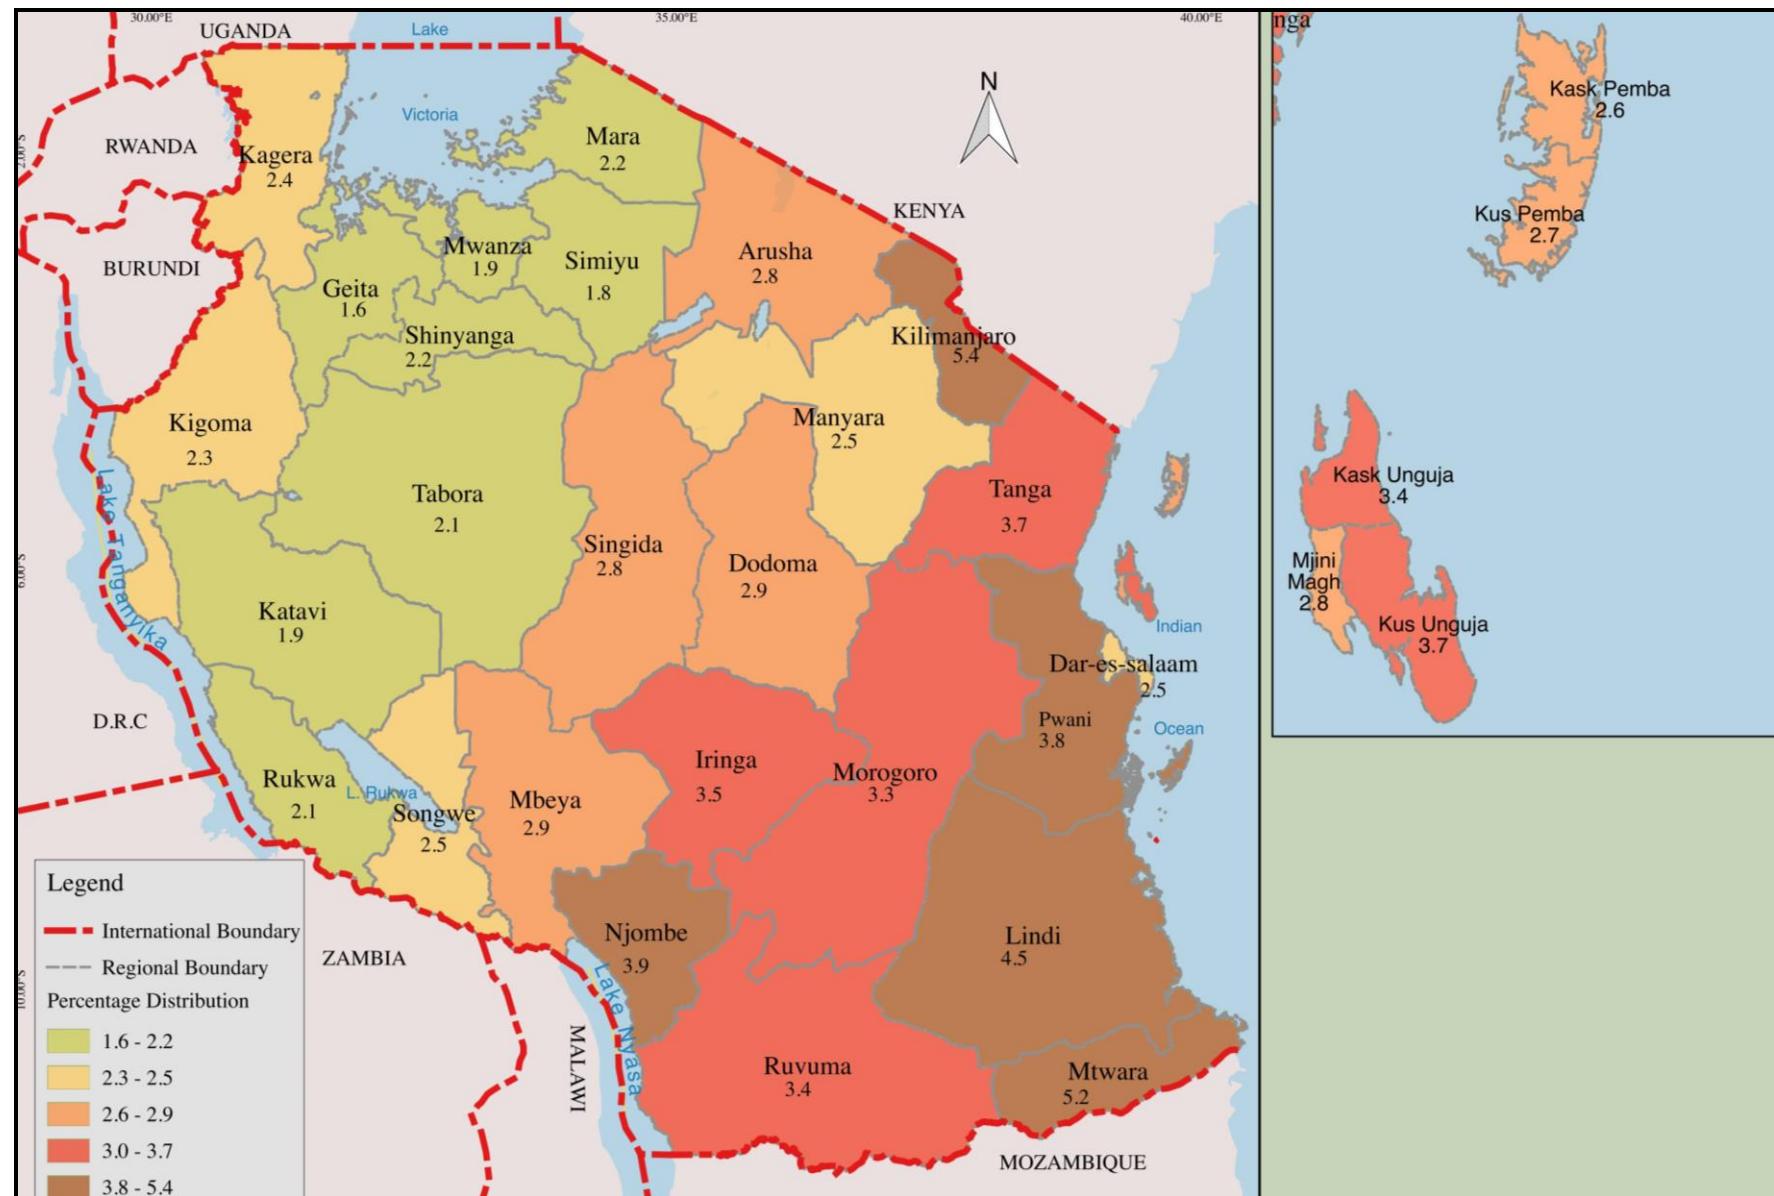

Map 3.7: Percentage Distribution of Population Aged 15 to 64 Years by Region: Population Projections 2025

Map 3.8: Percentage Distribution of Population Aged 60 Years and Above by Region: Population Projections 2025

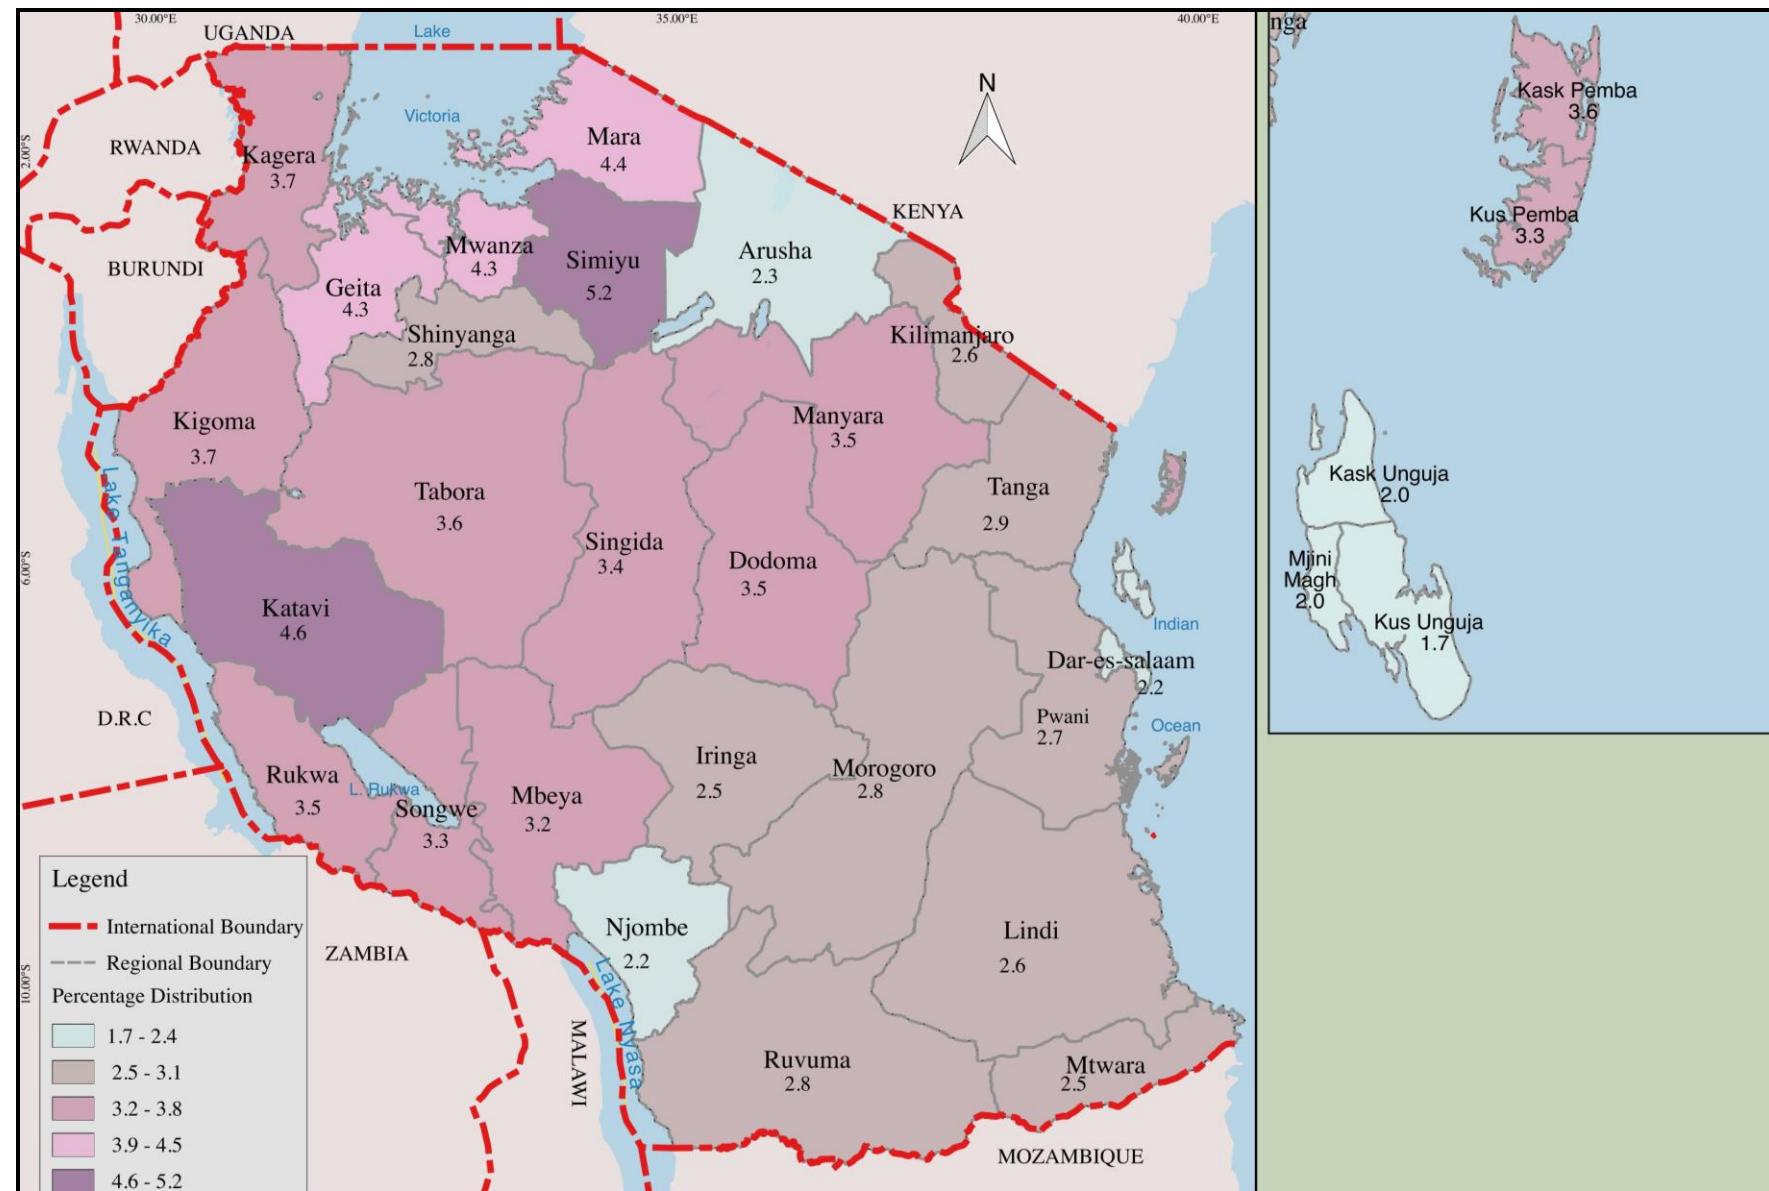

Map 3.9: Percentage Distribution of Population Aged 65 Years and Above by Region: Population Projections 2025

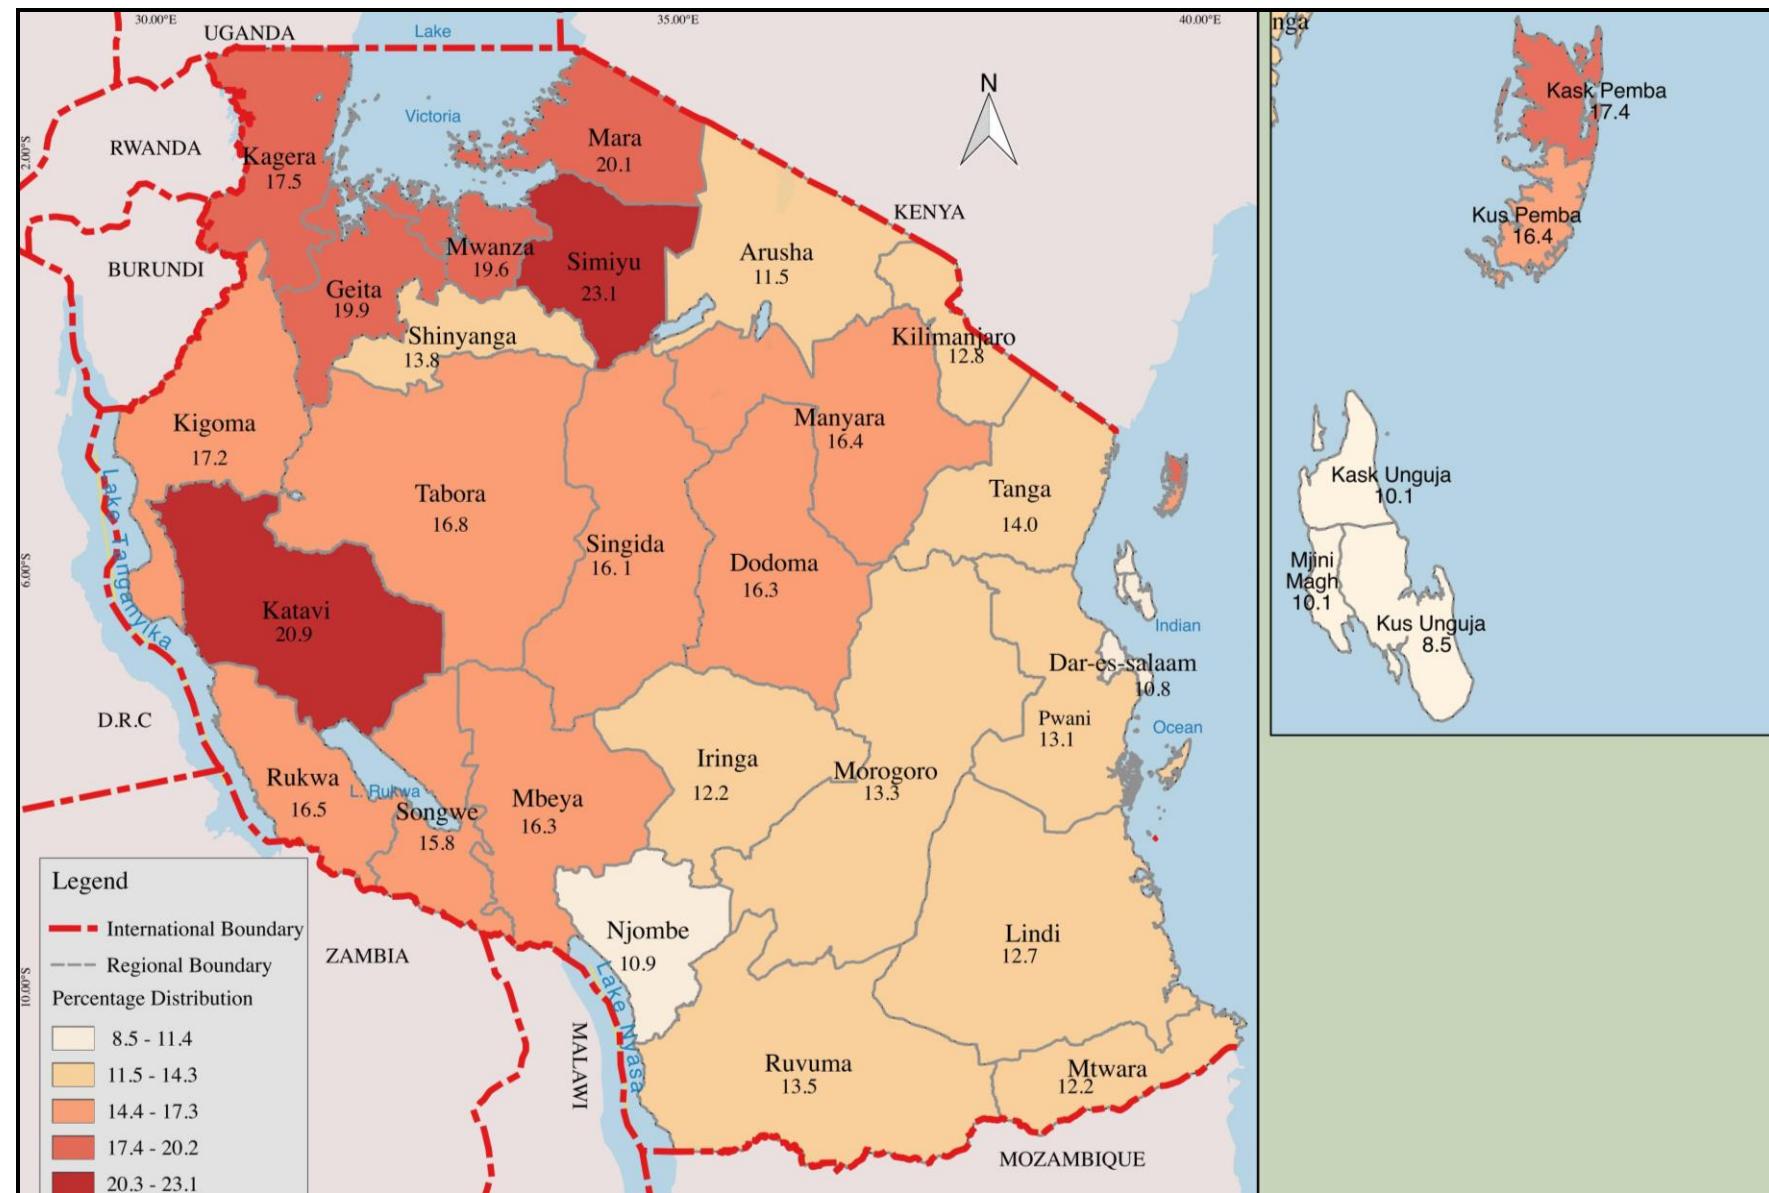

3.2.6 Thematic Maps on Selected Age Groups and Indicators for the Year 2030

The following maps contain some indicators that will be used to evaluate Sustainable Development Goals, 2030.

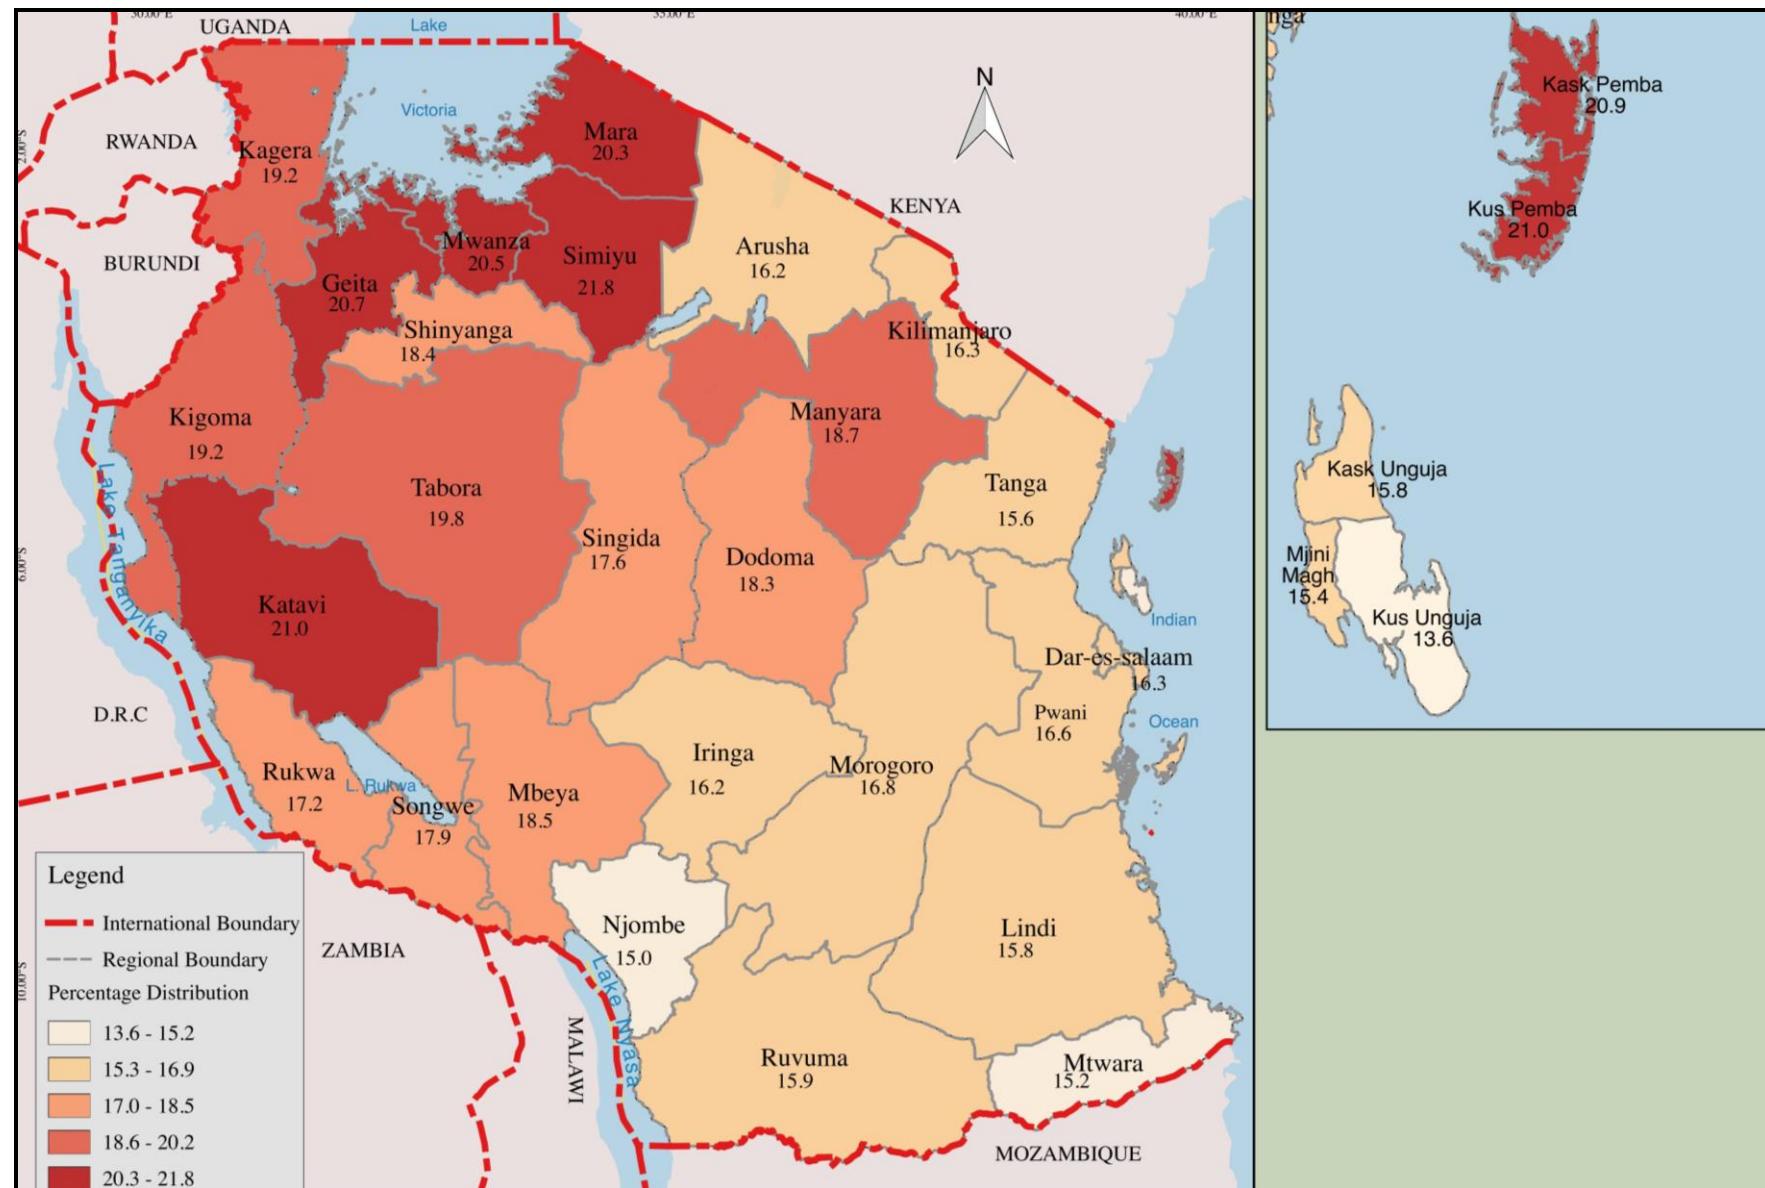

Map 3.10: Percentage Distribution of Children below Age One by Region: Population Projections 2030

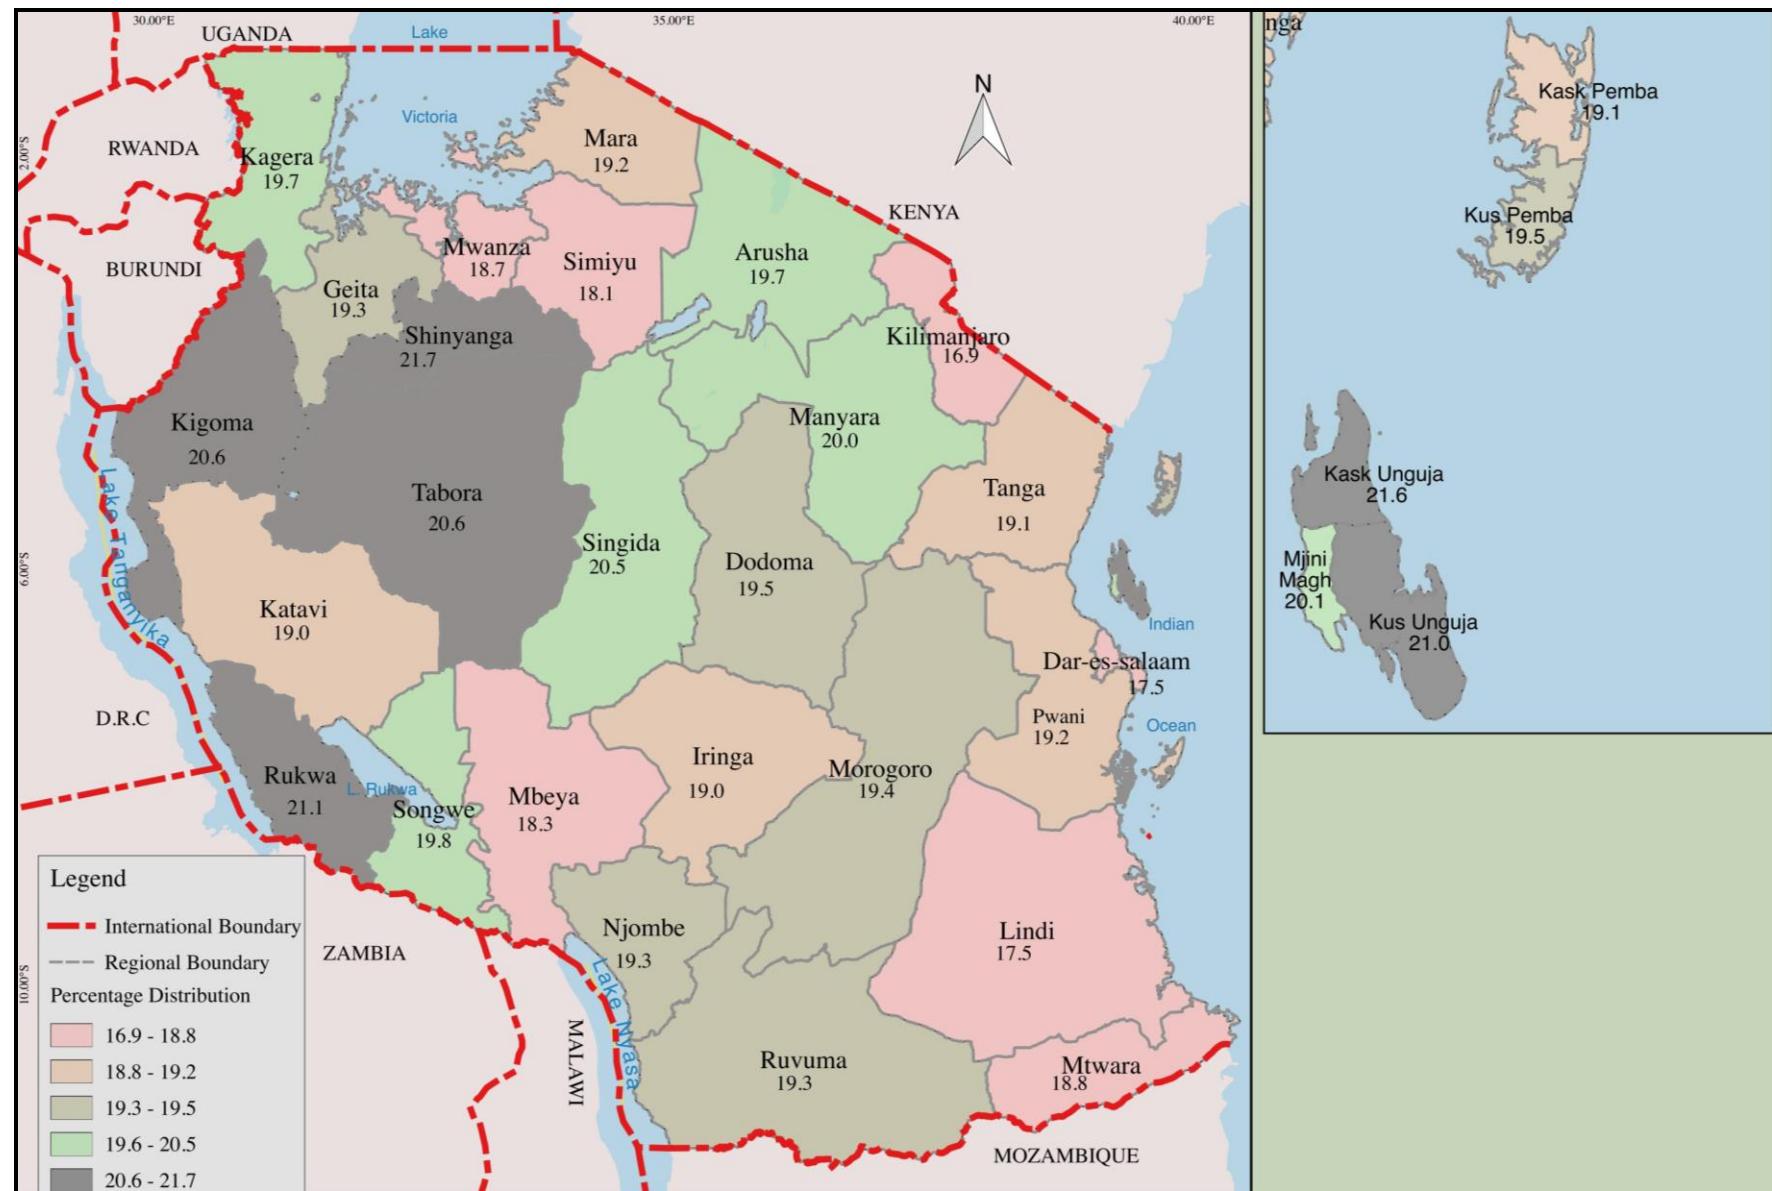

Map 3.11: Percentage Distribution of Children Aged 0 to 4 Years by Region: Population Projections 2030

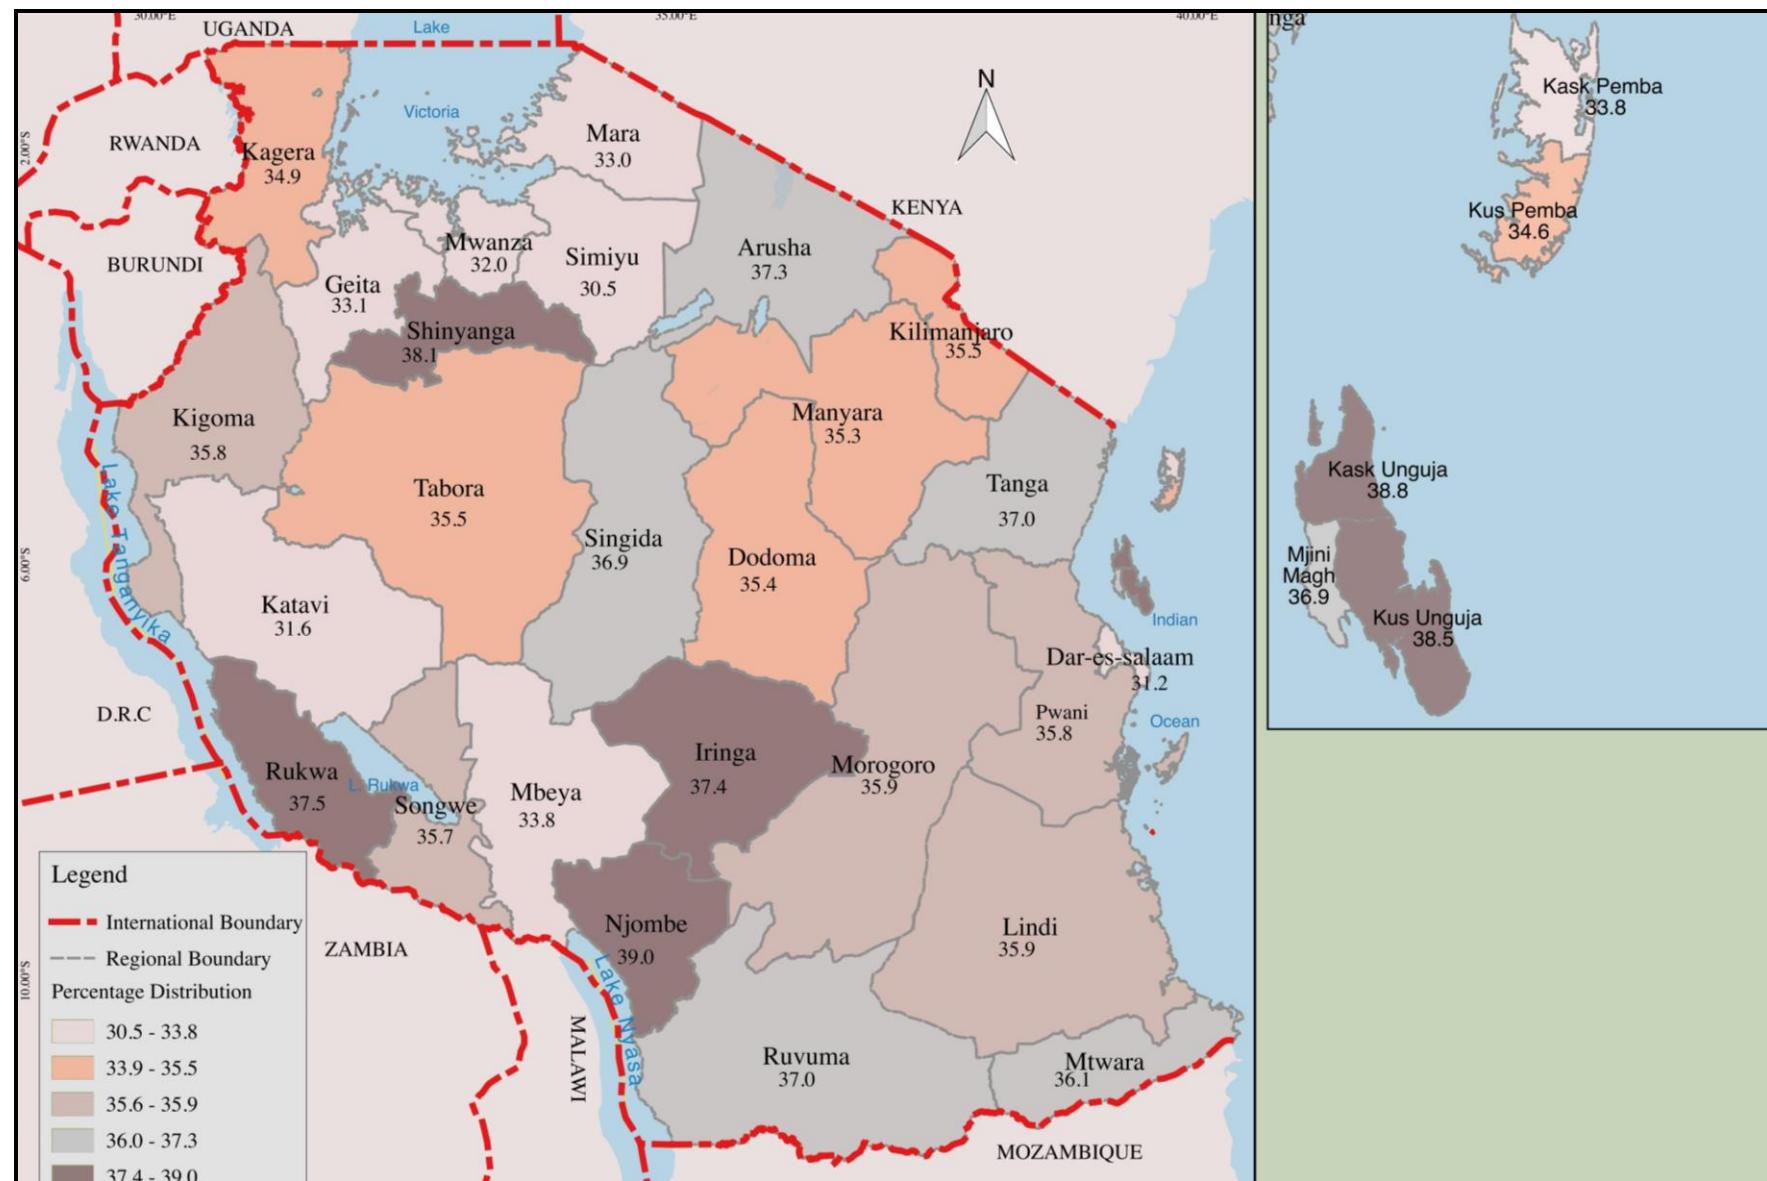

Map 3.12: Percentage Distribution of Population Aged 7 to 13 Years by Region: Population Projections 2030

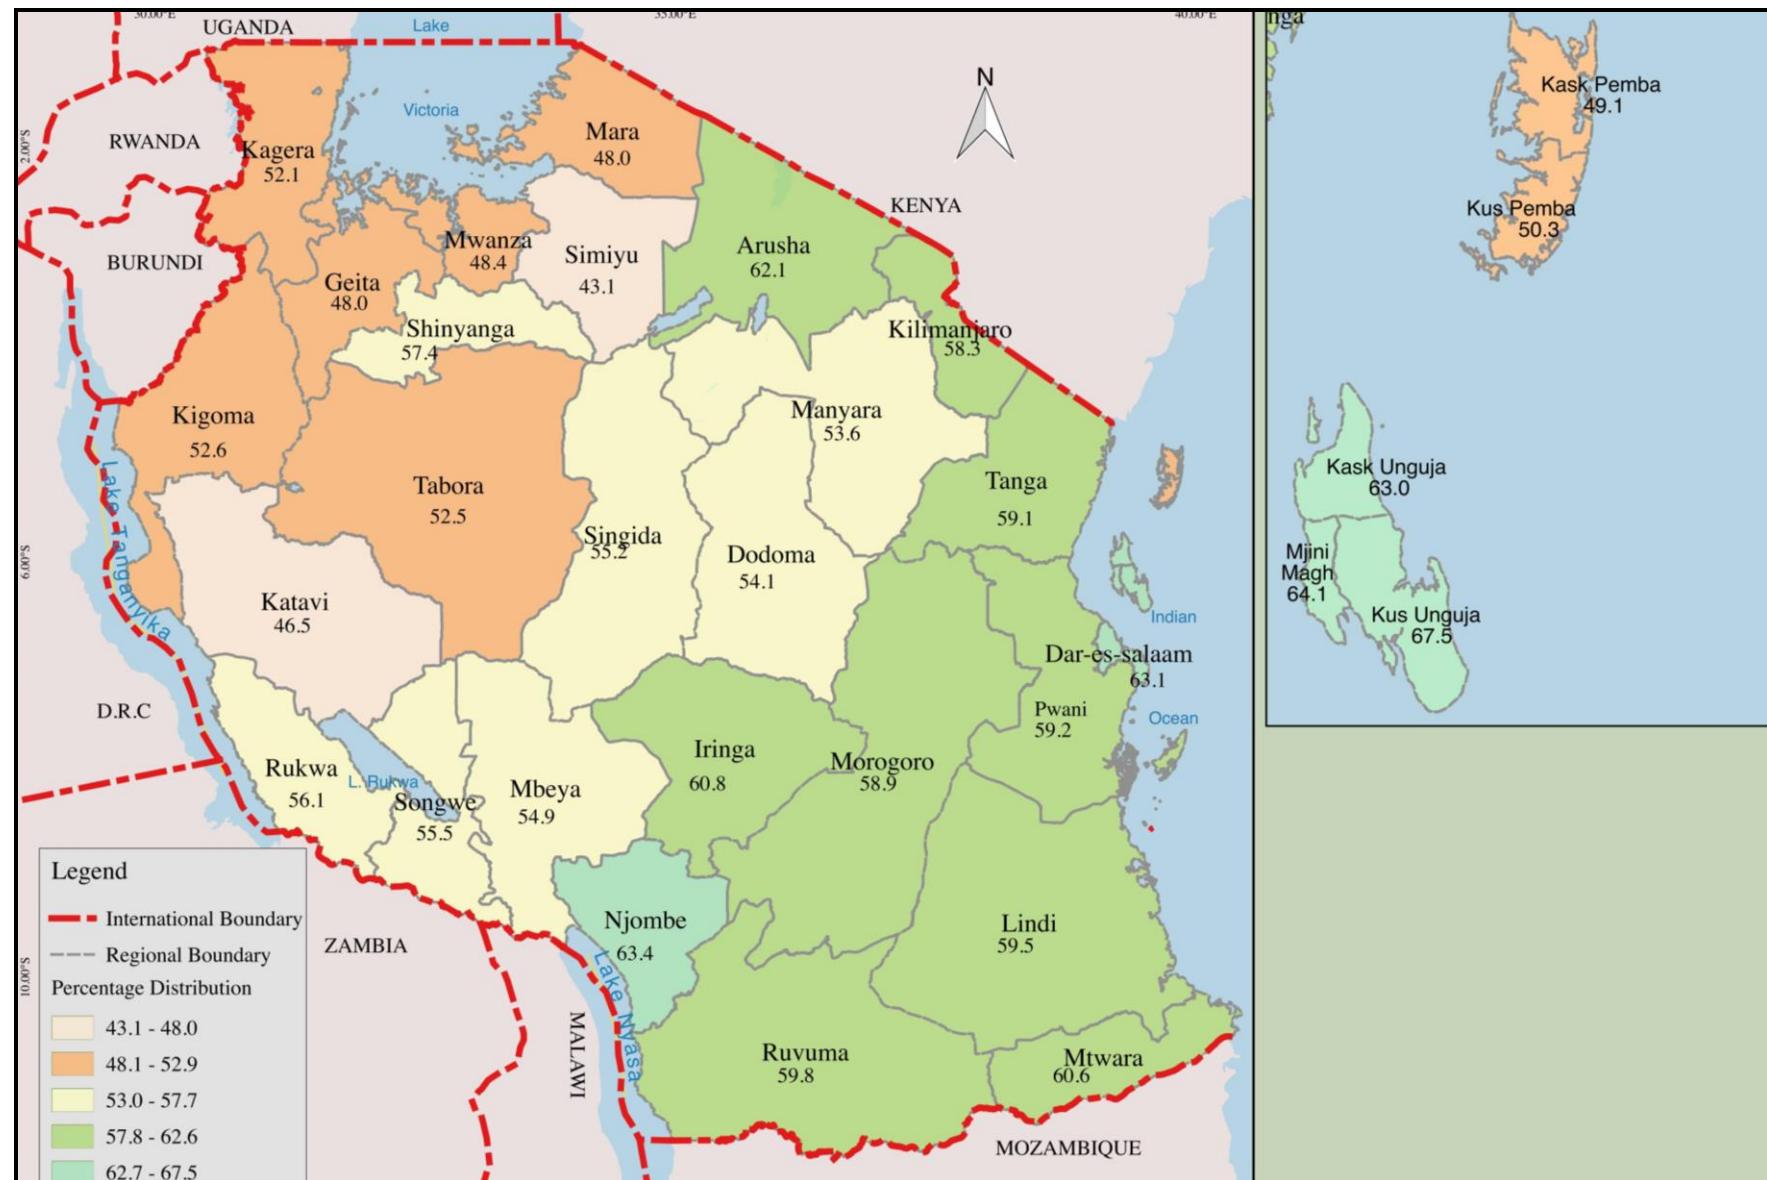

Map 3.13: Percentage Distribution of Population Aged 15 to 24 Years by Region: Population Projections 2030

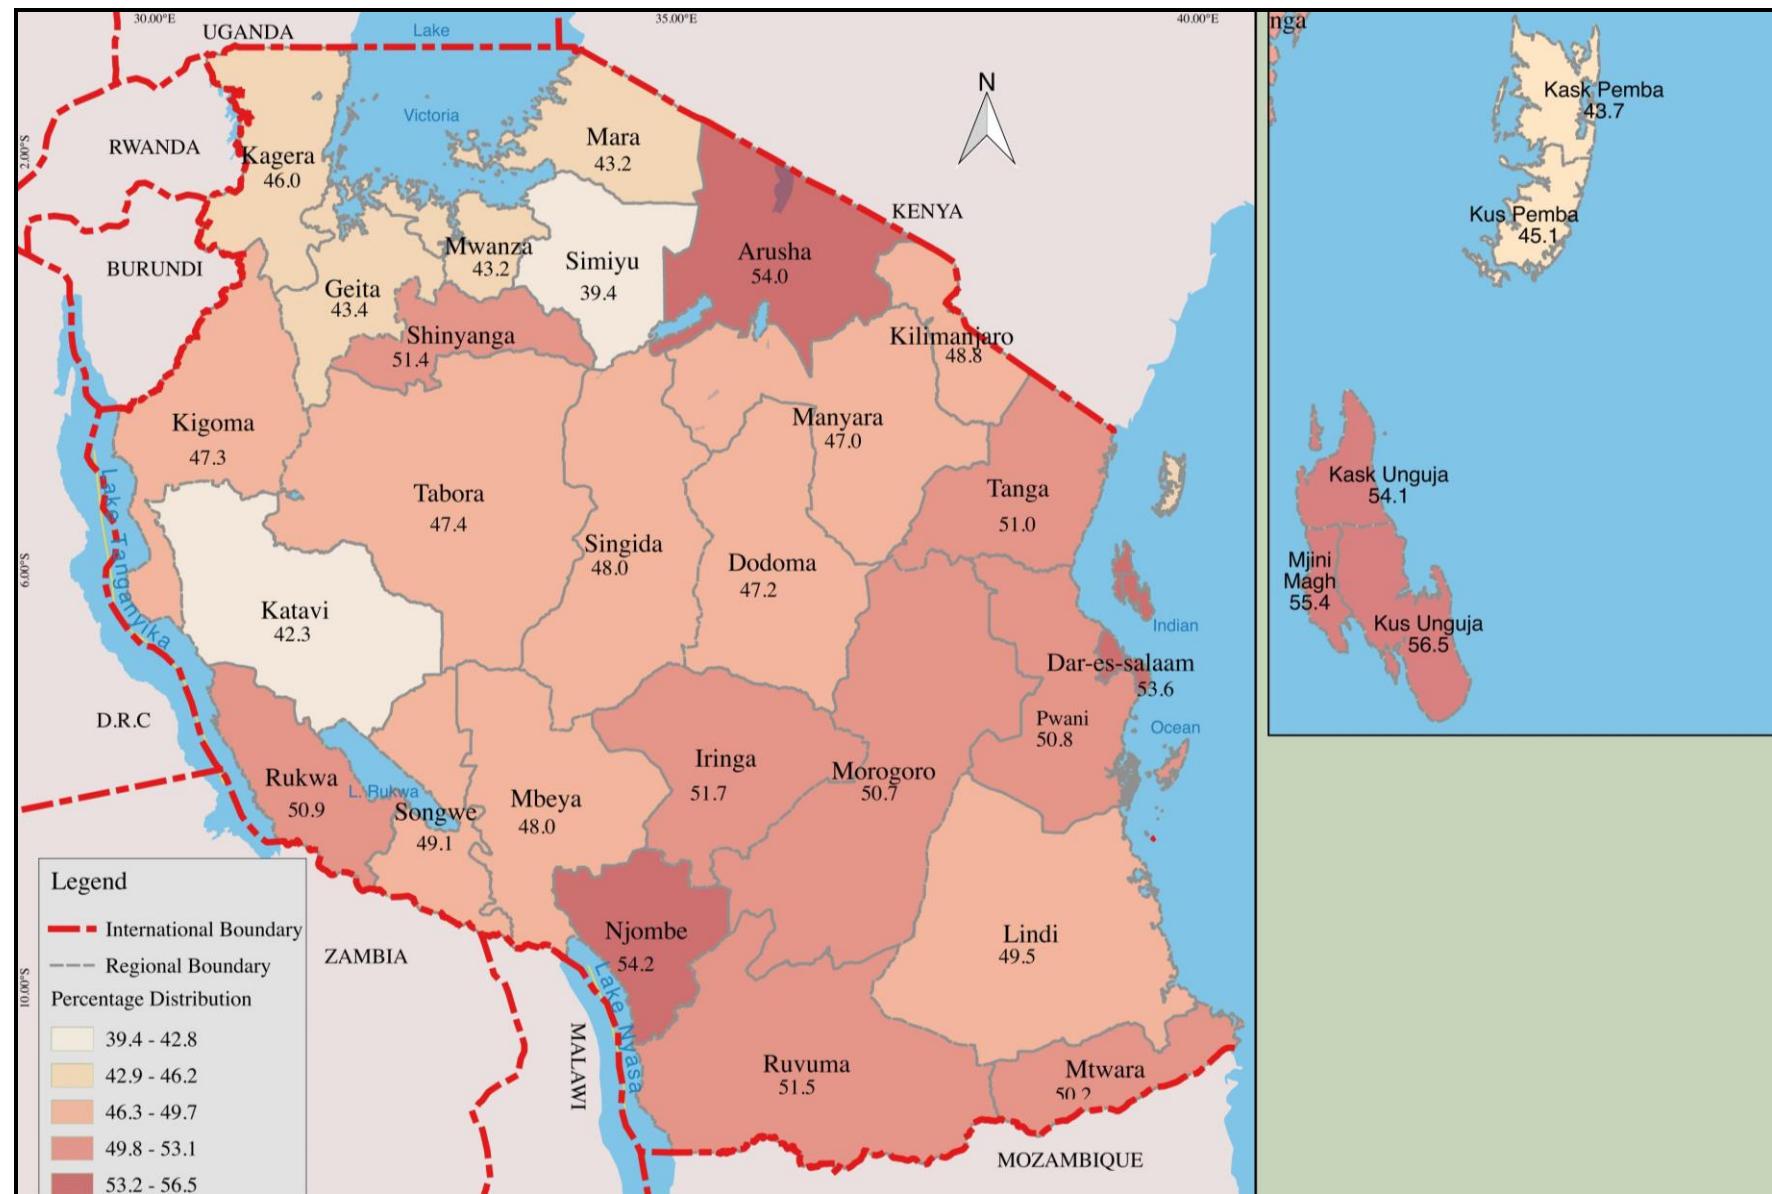

Map 3.14: Percentage Distribution of Population Aged 15 to 35 Years by Region: Population Projections 2030

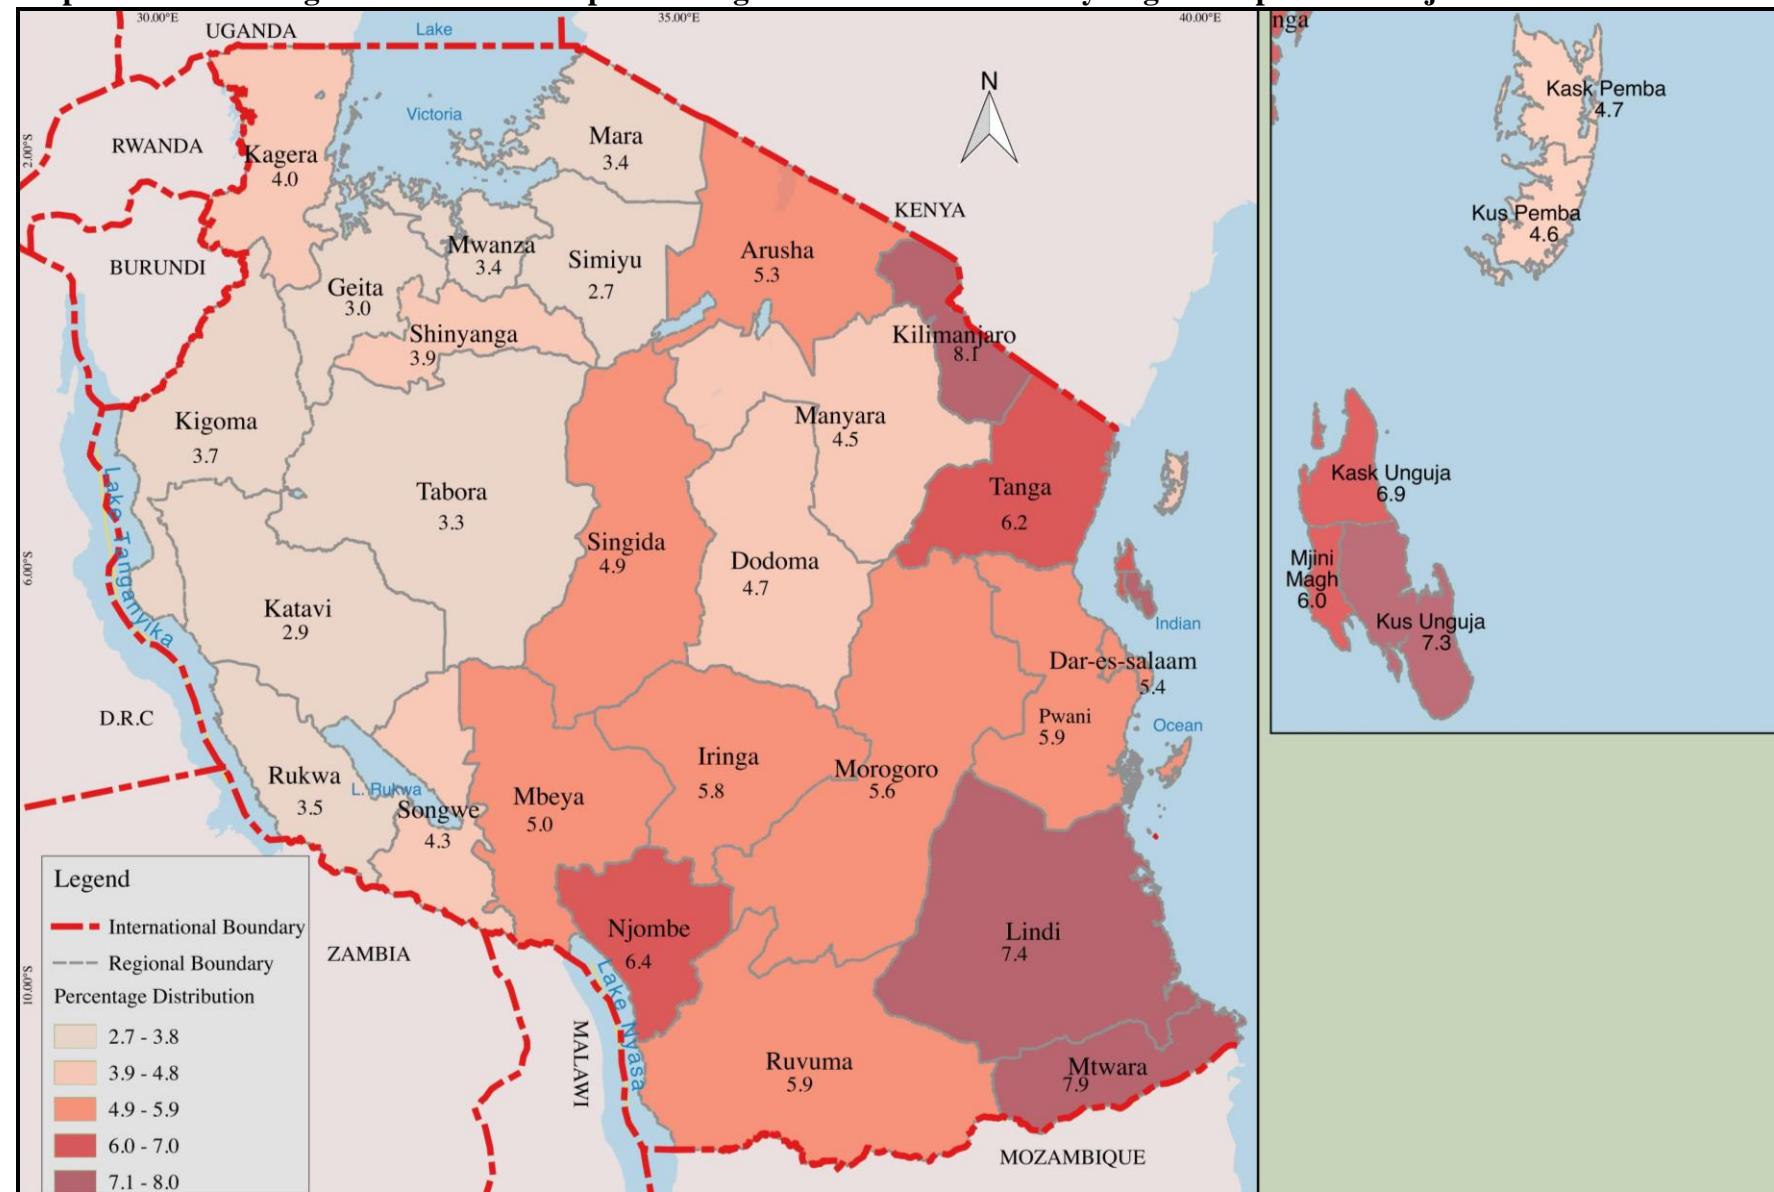

Map 3.15: Percentage Distribution of Female Population Aged 15 to 49 Years by Region: Population Projections 2030

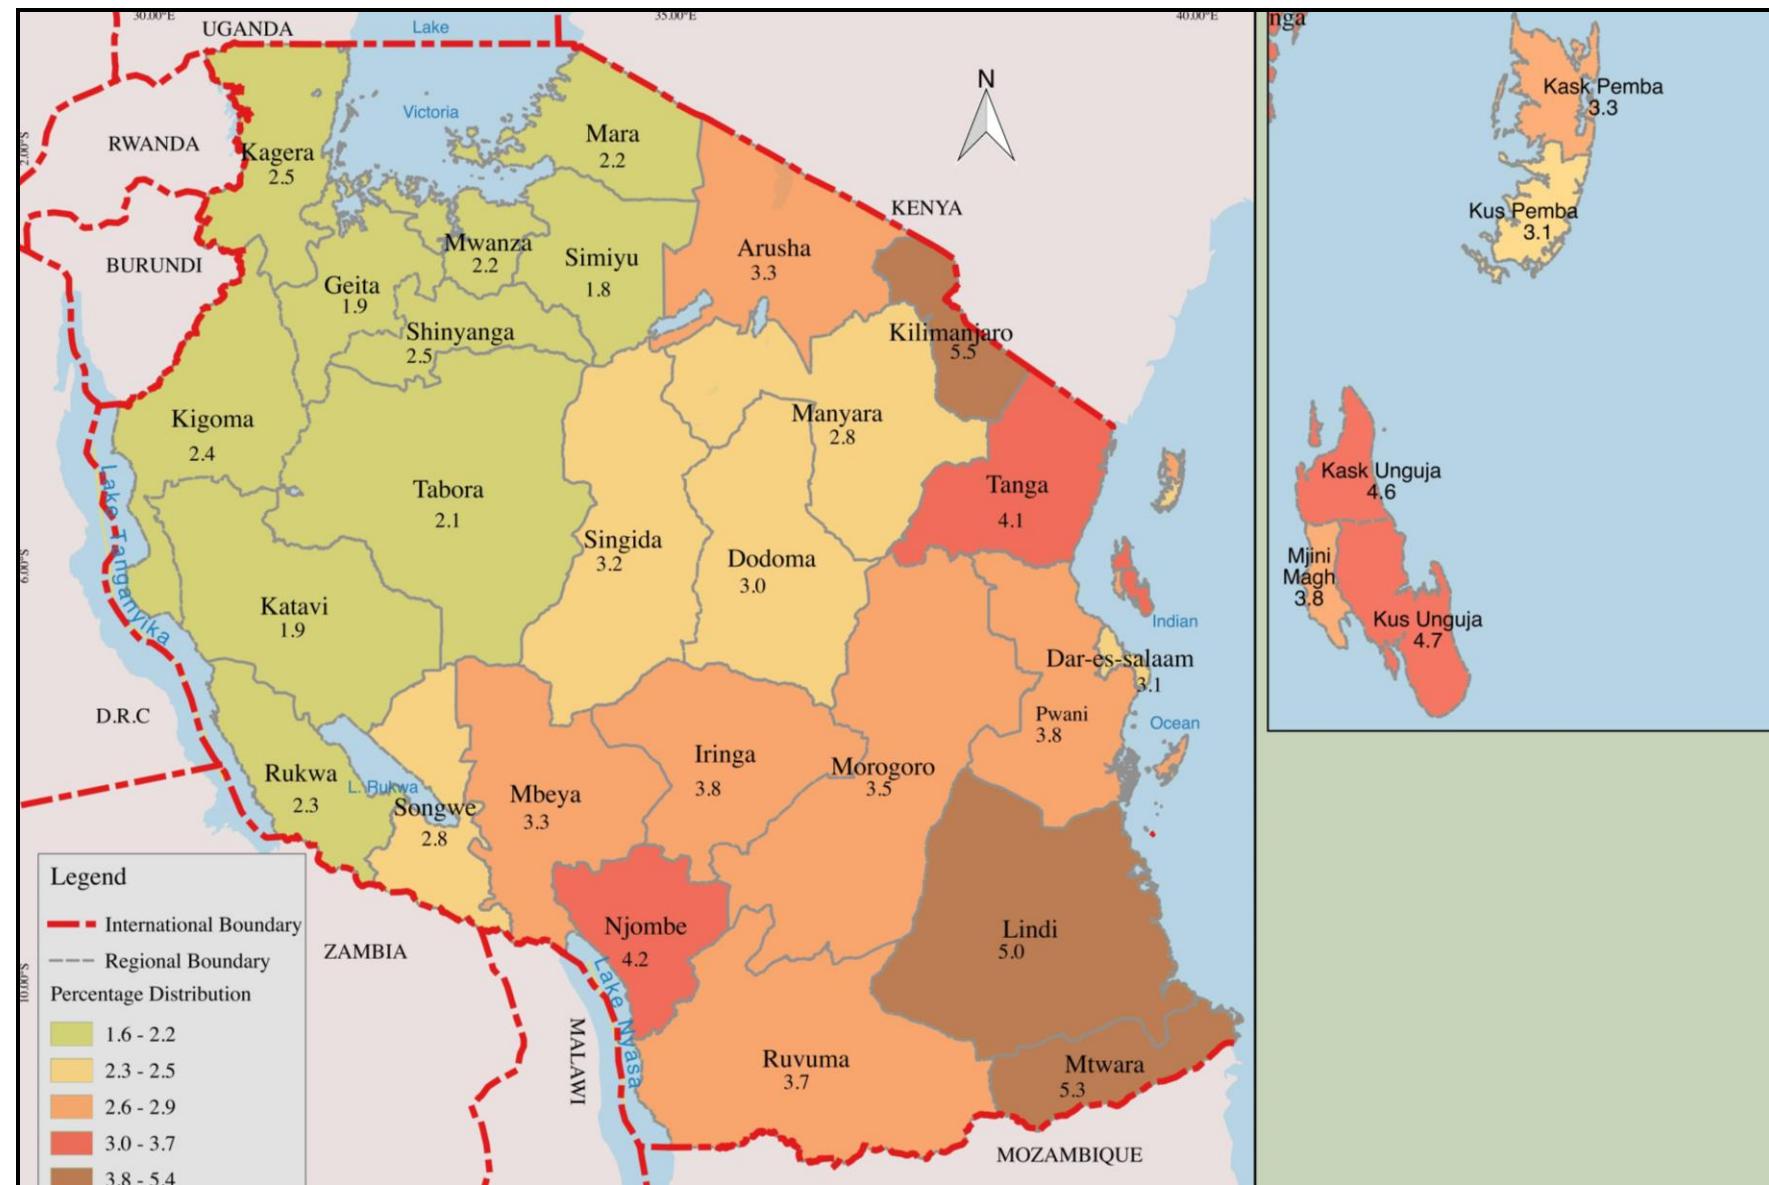

Map 3.16: Percentage Distribution of Population Aged 15 to 64 Years by Region: Population Projections 2030

Map 3.17: Percentage Distribution of Population Aged 60 Years and above by Region: Population Projections 2030

Map 3.18: Percentage Distribution of Population Aged 65 Years and above by Region: Population Projections 2030

Chapter Four

Population Projection's Statistical Tables

**The projection results are presented in Statistical Tables for the
Tanzania, Tanzania Mainland and Tanzania Zanzibar from 2013 to
2035 in Table A.1 to Table C.8 below.**

Table A.1: Tanzania: Population Projection by Age in Single Year, Five Year Age Groups and Sex: 2013 - 2015

Age	2013			2014			2015		
	Both Sexes	Male	Female	Both Sexes	Male	Female	Both Sexes	Male	Female
Total	46,356,279	22,585,059	23,771,220	47,831,361	23,323,466	24,507,895	49,359,408	24,088,086	25,271,322

Annex

List of Contributors

Contributors to the National Population Projection 2013 to 2035 Based on the 2012 Population and Housing Census are:

Management

Dr. Albina Chuwa	Director General, NBS
Ms. Mayasa M. Mwinyi	Chief Government Statistician, OCGS
Mr. Irenius Ruyobya	Director of Statistical Operation, NBS
Mr. Ephraim Kwasigabo	Director of Population Census and Social Statistics, NBS

Projection and Analysis Expert

Dr. Thomas McDevitt	Demographer and Projection Facilitator, USCB
Dr. Mike Levin	IT Specialists, US
Prof. Miline Mbonile	Demographer and Projection Facilitator, UDSM
Dr. Albina Chuwa	Director General, NBS
Ms. Mayasa M. Mwinyi	Government Statistician, OCGS
Dr. Emmanuel K. Baingana	UNAIDS
Mr. Frederick Macha	UNAIDS
Mr. Ephraim Kwasigabo	Director of Population Census and Social Statistics, NBS
Mr. Irenius Ruyobya	Director of Statistical Operation, NBS
Ms. Asia Hassan Mussa	Principal Statistician, OCGS
Mr. Abdul-Majid Jecha	Principal Statistician, OCGS
Ms. Sabina R. Daima	Principal Statistician, OCGS
Mr. Seif Ahmad Kuchengo	Senior Statistician, NBS
Mr. Ariv Severe	Senior System Analyst, NBS
Bakar Kombo Omar	Senior Programmer, OCGS
Ms. Neema Ngure	Statistician, NBS
Mr. Mdoka Omar Maulid	Statistician, NBS
Ms. Kokulamuka Aulea	Intern, NBS
Mr. Frank Lyimo	Intern, NBS

Editorial Team

Dr. Albina Chuwa	Chairperson, NBS Editorial Board
Mr. Ephraim Kwasigabo	Director of Population Census and Social Statistics
Mr. Irenius Ruyobya	Director of Statistical Operation
Mr. Nathanael Mbalilaki	Member of Editorial Board
Ms. Aldegunda Komba	Deputy Chairperson

Ms. Radegunda Maro	Member of Editorial Board
Mr. Sylvester M. Ngallaba	Member of Editorial Board
Mr. Vincent Mugaya	Member of Editorial Board
Dr. C. Kasala	Member of Editorial Board
Mr. Seif A. Kuchengo	Senior Statistician/Subject Matter
Mr. Mdoka Omari Maulid	Statistician/Subject Matter
Ms. Hadija I. Abdul	Office Secretary
Ms. Veronica C. Mwangoka	Secretary, NBS Editorial Board
