PREFACE

At the end of the 2007/08 Agricultural Year, the Office of the Chief Government Statistician, (OCGS) in collaboration with National Bureau of Statistics (NBS) and Ministries of Agriculture and Natural Resources; Livestock and Fisheries conducted the 2007/08 Agricultural Sample Census. This is the second Sample Census of Agriculture to be carried out in Zanzibar, the first one was conducted in 2002/03 Agricultural year.

It is considered that this census is one of the largest to be carried out in Africa and indeed, in many other countries of the world. The census collected detailed data on crop production, crop marketing, crop storage, livestock production, fish farming, and poverty indicators. In addition to this, the census was large in its scope and coverage as it provides data that can be disaggregated at district level and thus allow comparisons with the 2002/03 National Sample Census of Agriculture. The census covered smallholders in rural areas only and all the large scale farms. This report provide the results of the small holder farming in livestock sector. The results presented in this report are detailed data on cattle, goats, pigs, sheep, chicken and other livestock.

The extensive nature of the census in relation to its scope and coverage is a result of the increasing demand for more detailed information that can assist in the proper planning of the agricultural sector and in the administrative decentralization of planning to district level. It is hoped that this report will provide new insights for planners, policy makers, researchers and others involved in the agricultural sector in order to improve the prevailing conditions faced by agricultural households in the country. Furthermore, the report will provide deeper understanding on the procedures and techniques applied in carrying out the census.

On behalf of the Government of Tanzania Zanzibar, I wish to express my appreciation for the financial support provided by the development partners, in particular, the Department for International Development (DFID) and the Japanese Government through the Japan International Cooperation Agency (JICA) and others who contributed through the pooled fund mechanism.

My appreciation also goes to all those who in one-way or the other, have contributed to the success of the survey. In particular, I would also like to mention the enormous effort made by the Planning Group composed of professionals from the Agricultural and Environmental Statistics Section of the Office of Chief Government Statistician (OCGS), Agricultural Statistics Department of the National Bureau of Statistics (NBS), Ministry of Agriculture and Natural Resources, Ministry of

Livestock and Fishery Zanzibar. Other are Ministry of Food Security and Cooperatives, Ministry of Livestock Development and Fisheries, Ministry of Water and Irrigation, the Prime Minister's Office, Regional Administration and Local Government, Ministry of Industries, Trade and Marketing in Tanzania Mainland and the Food and Agriculture Organization of the United Nations and the Censuses and Surveys Technical Working Group (CSTWG).

Finally, I would like to extend my sincere gratitude to all professional staff of the Office of the Chief Government Statistician and National Bureau of Statistics, Mainland, the sector Ministries of Agriculture and Natural Resources the Consultants as well as Regional and District Supervisors and field enumerators for their commendable work. Certainly, without their dedication, the census would not have been such a success.

Mr. Mohamed Hafith Rajab
Chief Government Statistician
Office of the Chief Government Statistician, Zanzibar
Zanzibar

EXECUTIVE SUMMARY

Agriculture is an important economic sector of the Zanzibar economy in terms of food production, employment generation, production of raw materials for industry, and generation of foreign exchange earnings. The agricultural sector produces about 30.8 percent of GDP (Economic Survey, 2009) and the contribution of livestock was estimated to be 4.5 percent.

In 2007, the Government of Tanzania launched the Agricultural Sample Census as an important part of the Poverty Monitoring Master plan which supports the production of statistics for advocacy of effective public policy, including poverty reduction, access to services, gender, as well as the standard production data normally collected in an agriculture census. The 2007/08 Agricultural Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, district, and National levels, rural development agencies, funding institutions, researchers, NGOs, farmers' organizations, etc. This report provides detailed description of the state of the livestock sub-sector in Zanzibar for the agricultural year 2007/08. The detailed tabulations and analysis were based mainly on smallholder farms. In some cases, contribution of large scale farms is also included to give the overall Zanzibar estimates.

The main types of livestock and poultry covered in the 2007/08 Agricultural Sample Census are cattle, goats, sheep, pigs, chicken, ducks, turkeys, rabbits, and donkeys. There was an equivalent of 170,715 livestock units in total representing a total of 228,538 major livestock of different species. The goat livestock units were about 13,794, sheep were about 114.8 and pigs about 1,005 units. Chicken were kept by 60% of the households, while cattle were kept by 30% of the agricultural households.

The trend shows that the number of goats increased by 31 percent, sheep by 18 percent and pigs by 10 percent per annum, while the number of cattle had declined by -0.9 percent between 2003 and 2008. The average number of cattle and goats per household were 4 and 9 respectively. Most of the cattle were kept in the Central district followed by Micheweni, Wete and West districts. However, Micheweni district had more cattle rearing households than the rest of the districts. Milk production from cows during the wet season was 115,021 liters (56%) and dropped to 87,490 litres (43%) during the dry season. Average milk production per cow was 2.5 liters during the wet season and 2.3 litres during the dry season. The number of milked cows also dropped from 44,718 during the wet season to 36,639 in the dry season. The price of milk was slightly higher than in the Mainland whereby the prices were Tshs. 508 in the wet season and increased to Tshs. 538 during the dry season.

Regarding small ruminants, Central district has more households raising goats than any other district. About 4 percent of the agricultural households in Tanzania Zanzibar kept improved goats although, the number of improved goats was less than 20 percent. Sheep on the other hand are less important and only 574 households raised sheep most of which were found in the West district. With regard to chicken, over 90 percent of agricultural households raised chicken and a bigger proportion (21%) of chicken were kept in the West district and were dominated by the unimproved type (local). The trend shows that, the number of chicken has remained stagnant between 2003 and 2008. However, the number of layers has increased by 36 percent with an annual growth rate of about 7 percent, though there was a decline of 30 percent in the number of broilers.

Apart from providing meat, milk and draught power, livestock supply organic fertilizers in terms of manure. In Zanzibar, a total of 6,806 households (7.7% of all households planting during Long rain) use organic fertilizers. Organic fertilizer was used on only 2,926 ha representing 7.8 percent of the total planted area during long rain season. Farm yard manure was used in all the districts but, was more common in the Central, South, North B and West. Mkoani and Chakechake were at the bottom in terms of organic fertiliser use.

Livestock diseases have remained the most challenging constraint in the livestock sector. Common diseases affecting ruminants include Tick Borne Diseases (TBD), Tse- tse fly infestations, FMD and Lumpy skin Disease. Almost 50 percent of the cattle raising households encountered Tick Borne Diseases, and the problem was more serious in the Central district followed by Chake chake, Micheweni and Mkoani. Spraying with acaricides was the most common method used to control infections. Dipping and smearing were the commonest methods of tick control. For chicken, the Newcastle Disease and the Fowl Typhoid were reported to be a challenge in most of the agricultural households and only 10 percent of the households vaccinated their chicken against the Newcastle disease.

Access to extension services varied between the districts and Micheweni district had the highest access (79%) followed by Chakechake(74%), Wete and Mkoani districts, each with (65%). North 'A', West and North 'B' districts had less access to extension services. The government accounted for 50 percent of the extension services provided, other sources being NGOs/development projects, newspapers, radios, and televisions.

1.0 BACKGROUND INFORMATION

Agriculture is an important economic sector of the Zanzibar economy in terms of food production, employment generation, production of raw materials for industries, and generation of foreign exchange earnings. The agricultural sector contributes about 30.8 percent to the GDP (Economic Survey, 2009). Having a diversity of climatic and geographical zones, Zanzibar's farmers grow a wide variety of food and cash crops as well as fruits, vegetables and spices. In 2009, the percentage share of livestock sub-sector to GDP was 4.5 percent. The main types of livestock raised in Zanzibar are cattle, goats, sheep, pigs and chicken. Besides meat production, other products from livestock include hides and skins, milk and eggs. Livestock also contributes to crop and vegetable production by providing draft power for cultivation and organic manure.

This report covers the Livestock Sector in Tanzania Zanzibar (Volume VI). Other census reports include; the Technical Report (Volume I), National Crop Report (Volume II), National Livestock Report Volume III, 21 Regional Census Reports for Tanzania Mainland (Volume IV) and Large Scale Farms Report (Volume V)

This report is in four main sections: Introduction, Results, Conclusions and Appendices. The definitions relating to all aspects of this report can be found in the questionnaires (Appendix I).

2.0 INTRODUCTION

This part of the report provides the technical and operational description of the National Sample Census of Agriculture (NSCA), carried out in the rural areas of Tanzania Mainland and Tanzania Zanzibar for the 2007/08 agricultural year. It also explains the sampling procedures, designing and implementation of the data processing system.

2.1 Rationale for Conducting the National Sample Census of Agriculture

The Government of Tanzania has embarked on various plans geared to eradicate extreme poverty by the year 2025 and Tanzania Zanzibar by the year 2020. In order to facilitate intervention and monitoring activities of the Poverty Monitoring Master Plan, the government has planned a series of censuses and surveys to assist in policy formulation, planning and to track on changes in the well-being of the population of Tanzania Mainland and Tanzania Zanzibar. In this Master Plan, a series of Agricultural Censuses and Surveys are planned to be done after every five years. The first one was undertaken in 2002/03 agricultural year, the second for the year 2007/08 and the third one for the year 2012/13 and so on depending on the availability of financial resources.

Demands for reliable and timely agricultural data have become significantly for monitoring outcomes and progress of the poverty monitoring tools like the Agricultural Sector Development Programme (ASDP) and performance of the respective MDAs (ASLMs).

Following the decentralization of the Government's administration and planning functions, there has been a pressing need for agricultural and rural development data disaggregated at regional and district levels. The availability of district level estimates provides essential baseline information on the state of agriculture that supports decision making by the Local Government Authorities and in the design of District Agricultural Development and Investment Projects (DADIPS). The increase in investment is an essential element in the National Strategy for Growth and Reduction of Poverty.

2.2 Census Objectives

The 2007/08 Agricultural Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, regional and national levels, rural development agencies, funding institutions, researchers, NGOs, farmers' organizations, and the like. The dataset is numerous in its sample and detailed in its scope and coverage to meet the user demand.

The census was carried out in order to:

- Identify structural changes in the size of farm household holdings, crop and livestock production, farm inputs and farm implement use. It also seeks to determine if there are any improvements in rural infrastructure and the level of agricultural household living conditions;
- Provide benchmark data on productivity, production and agricultural practices in relation to policies and interventions promoted by the Ministry of Agriculture and Natural Resources and other stakeholders
- Obtain data that will be used to address specific issues such as: food security, rural poverty, gender, agro-processing, marketing, service delivery, etc.

2.3 Census Coverage

The census was conducted for both large and small scale farms. The overall sample for small holders in the 2007/08 Agricultural Sample Census had a total of 317 rural EAs. The data were

collected from a sample of 4,755 rural agricultural households. Data were also collected from 38 Large scale farms on a complete enumeration basis.

2.3.1 Census Scope

The census covered agricultural households in detail as well as many other aspects of rural development. It was conducted using three different questionnaires:

- Small scale farm questionnaire;
- Community level questionnaire, and
- Large scale farm questionnaire.

The small scale farm questionnaire was the main census instrument and it included questions related to crop and livestock production and practices, population demographics, access to services, community resources and infrastructure, and issues on poverty and gender. The main topics covered were:

- Household demographics and activities of the household members;
- Land access/ownership/tenure and use;
- Crop and livestock production and productivity,
- Access to inputs and farming implements,
- Access and use of credit;
- Access to infrastructure (roads, district and regional headquarters, markets, advisory services, schools, hospitals);
- Crop marketing, storage and agro processing;
- Tree farming, agro-forestry, and fish farming;
- Access and use of communal resources (grazing land, communal forests, water for humans and livestock, beekeeping);
- Investment activities (irrigation structures, water harvesting, erosion control, fencing);
- Off farm income and non agricultural related activities;
- Households living conditions (housing, sanitary facilities);
- Livelihood constraints; and
- Poverty Indicators.

The community level questionnaire was designed to collect village level data such as access and use of common resources, community tree plantation and seasonal farm gate price.

The Large Scale Farm questionnaire was administered to large farms either privately or corporately managed.

2.3.2 Main Activities Undertaken

The main focus at all stages of census execution was on data quality which was strongly emphasized all the time. The main activities undertaken include:

- Census organization
- Tabulation plan preparation
- Sample design
- Design of census questionnaires and other instruments
- Pilot-test
- Training of trainers, supervisors and enumerators
- Information Education and Communication (IEC) campaign
- Data Collection
- Field supervision and consistency checks
- Data processing:
 - Scanning
 - Structure formatting application
 - Batch validation application
 - Manual data entry application
 - Tabulation preparation using SPSS and Excel
- Table formatting and charts using Excel, map generation using Arc GIS and Excel
- Report preparation using Word and Excel

2.4 Census Methodology

2.4.1 Census Organization

The census was conducted by the Office of the Chief Government Statistician, (OCGS), Ministry of Agriculture and Natural Resources and Ministry of Livestock and Fisheries in collaboration with National Bureau of Statistics (NBS). At the national level, the census was headed by Chief Government Statistician in collaboration with the Director General of the National Bureau of Statistics. The Planning Group formed by the Director General of NBS and the Chief Government Statistician of OCGS consisted of staff from the Department of Agricultural Statistics of NBS,

Department of Economic Statistics of OCGS, Department of Policy and Planning of the Ministry of Agriculture, Food Security and Cooperatives, Department of Policy and Planning of the Ministry of Livestock and Fisheries Development in Tanzania Mainland, the Ministry of Livestock and Fisheries and the Ministry of Agriculture and Natural Resources in Zanzibar. The Planning Group was responsible for all the census operations.

The implementation of the census activities at regional level was overseen by the Regional Statistical Officers and Regional Agricultural Officers. At district level, the implementation of the census activities were managed by District Agricultural Development Officers (DADOs) while at National level, there was a national mobile team to supervise the census operations.

The Censuses and Surveys Technical Working Group (CSTWG) under MKUKUTA provided support in sourcing financing, approving budget allocations and monitoring progress of the census.

A Technical Committee for the census was established with members from key stakeholder organizations and its function was to approve the proposed instruments and procedures developed by the Planning Group. It also approved the tabulations and analytical reports prepared from the census data.

2.4.2 Tabulation Plan Preparation

The tabulation plan was developed considering the tabulations from previous 2002/03 census and surveys to allow trend analysis and comparisons as well as the needs of end users.

Table 3.1: Census Sample Size

2.4.3 Sample Design

The Mainland sample consisted of 317EAs/ villages. These EAs/villages were drawn from the Zanzibar National Master Sample (NMS) developed to serve as a National framework for the conduct of household based surveys in the country. The National Master Sample was developed from the previous 2002 Population and Housing Census. The total of 317 EAs were selected and 4,755 agricultural households were covered (Table 3.1).

Description	Number
Households	4,755
Villages/EAs	317
Districts	9
Regions	5

A two stage sampling was used. The number of villages/Enumeration Areas (EAs) was selected for the first stage with a probability proportional to the number of villages/EAs in each district. In the

second stage, 15 households were selected from a list of agriculture households in each Village/EA using systematic random sampling. Table 1 gives the sample size of households, villages/EAs and districts.

2.4.4 Questionnaire Design and Other Census Instruments

The questionnaires were designed following users demand to ensure that the questions asked were in line with the users data needs. Several features were incorporated into the design of the questionnaires to increase the accuracy of the data:

- Where feasible, all variables were extensively coded to reduce post enumeration coding errors;
- The definitions for each section were printed on the opposite page so that the enumerator could easily refer to the instructions whilst interviewing the respondent;
- The responses to all questions were placed in boxes printed on the questionnaire, with one box per character;
- This feature made it possible to use scanning and Intelligent Character Recognition (ICR) technologies for data capture;
- Skip patterns were used to reduce unnecessary and incorrect coding of sections which do not apply to the respondent;
- Each section was clearly numbered to facilitate the use of skip patterns and provided a reference for data type coding for the programming of CSpro and SPSS. Three other instruments were used;
- Village Listing Forms were used for listing the households in the village/EA and from this list, a systematic sample of 15 agricultural households were selected;
- A Training Manual was used by the trainers for the cascade/pyramid training of supervisors and enumerators; and
- Enumerators Instructions Manual was used as a reference material.

2.4.5 Field Pilot-Testing

The Questionnaire was pilot-tested in both Unguja and Pemba. This was done to test the wording, flow and relevance of the questions and to finalise crop lists, questionnaire coding and manuals. In addition, several data collection methodologies had to be finalized, namely; livestock numbers, mixed cropping, use of percentages in the questionnaire and finalizing skip patterns and documenting consistency checks.

2.4.6 Training of Trainers, Supervisors and Enumerators

During the training, cascade/pyramid training techniques were employed to maintain statistical standards. The top level of training was provided to 13 National and regional supervisors. The trainers were members of the Planning Group from the Office of the Chief Government Statistician and Ministries of Agriculture and Natural Resources Livestock and Fishery.. The training concentrated more on questionnaires, listing forms, field level census methodology, and definitions. Emphasis was placed on consistency checking in the field. Tests were given to the supervisors and enumerators and the best 50 percent of the trainees were selected for the enumeration of the smallholder questionnaire and the community level questionnaire.

2.4.7 Information, Education and Communication (IEC) Campaign

Radios, televisions, newspapers, leaflets, t-shirts and caps were used to create awareness among the public on the Agriculture Sample Census. This helped in sensitizing the public on field level activities in order to increase the response rate. The t-shirts and caps were given to the field staff and village chairpersons. The village chairpersons assisted in locating the selected households.

2.4.8 Data Collection

Data collection activities for the 2007/08 Agricultural Sample Census lasted for three months from June to August, 2009. The interview method was used to collect data during the census. Data collection was monitored by a hierarchical system of supervisors which included the Mobile Response Team, Regional and District Supervisors. The Mobile Response Team, which was headed by the Manager of Agricultural Statistics Department, provided the overall direction to the field operations and responded to queries arising outside the scope of the training exercise. Decisions made on the definitions and procedures were then communicated back to all enumerators via the Regional and District Supervisors.. The enumeration was conducted by staff from the Ministry of Agriculture and Natural Resources and the Ministry of Livestock and Fisheries. Supervision was

provided by senior officers of the same Ministries and the Office of the Chief Government Statistician.

During the household listing exercise, 177 enumerators participated during the listing exercise and enumeration of small holder questionnaire. Additional five percent of the enumerators were kept as reserve in case of drop outs during the enumeration exercise. The enumerators were supervised by District Supervisors.

2.4.9 Field Supervision and Consistency Checks

Enumerators were trained on how to probe the respondents until they were satisfied with the response given before they recorded them in the questionnaire. The first check of the questionnaire was carried out by enumerators in the field during enumeration, followed by district, Regional and National Supervisors. Supervisory visits at all levels of supervision focused on checking on the completeness of the questionnaires and consistency. Inconsistencies encountered were corrected, and where necessary, call backs to the respondents were made by the enumerators to obtain the correct information. Further quality control checks were made by supervisors in each district.

2.4.10 Data Processing and Analysis

Data processing involved the following processes:

- Data entry;
- Data structure formatting;
- Batch validation; and
- Tabulation.

2.4.11 Data Entry

Scanning and ICR data capture technology was used. This did not only increase the speed of data entry but it also increased the accuracy of the data due to the reduction of keystroke errors. Interactive validation routines were incorporated into the ICR software to trap errors during the verification process.

Prior to scanning, all questionnaires underwent a manual cleaning exercise by checking that the questionnaire had a full set of pages, correct identification and good hand-writing. A score was given to each questionnaire based on the legibility and the completeness of the enumeration. This score was used to assess the quality of enumeration and supervision. CSPro was used for data entry of questionnaires that were rejected by ICR extraction application.

2.4.12 Batch Validation

A batch validation program was developed in CSPro in order to identify inconsistencies within a questionnaire. This is in addition to the interactive validation during the ICR extraction process. The procedures varied from simple range checking within each variable to more complexes checking between variables. It took 6 months to screen, edit and validate the data from the smallholder questionnaire. After the long process of data cleaning, the tabulations were prepared based on the pre-designed tabulation plan.

2.4.13 Tabulations

Statistical Package for Social Sciences (SPSS) was used to produce the Census tabulations and Microsoft Excel was used to organize the tables and compute additional indicators. Excel was also used to produce charts while Arc GIS was used for producing the maps.

2.4.14 Analysis and Report Preparation

The report writing was outsourced to Sokoine University of Agriculture, the analysis in the reports focused on district comparisons, time series and National production estimates. Microsoft Excel was used to produce charts; Arc GIS and Excel were used to generate maps, whereas Microsoft Word was used in the compilation and writing the report.

2.4.15 Data Quality Control

A great deal of emphasis was placed on data quality throughout the whole exercise from planning, questionnaire design, training, supervision, data entry, validation and cleaning/editing. As a result of this process, it is believed that the census is highly accurate and representative of what was experienced at field level during the Census Year. With very few exceptions, the variables in the questionnaires were within the norms for Tanzania and they followed the expected time series trends when compared to historical data.

2.5 Funding Arrangements

The 2007/08 Agricultural Sample Census was supported mainly by the Department for International Development (DFID) and the Japan International Cooperation Agency (JICA) who financed most of the operational activities. Other funds for operational activities were from the Government of Tanzania. In addition, technical assistance was provided by the Food and Agricultural Organization (FAO).

3.0 LIVESTOCK AND POULTRY RESULTS

3.1 Livestock Population and Growth

Livestock sector including poultry plays a significant role in the economy of agricultural households in Tanzania Zanzibar. Livestock generate considerable amount of cash income and determine the household economic and social status in many communities. An estimated 45,684 households (About 35 % of agricultural households) kept livestock (excluding poultry). The main types and number of livestock and poultry covered in the 2007/08 National Sample Census of Agriculture are cattle, goats, sheep, pigs, chicken, ducks, turkeys, rabbits, donkeys. This section analyzes the results in relation to the population, growth rates, husbandry and the provision of services at district levels. Also, it includes data on population and growth rate trends on livestock in comparison with the previous Agricultural Sample Census for the period between 1995 and 2008.

In the surveyed households, cattle were the most dominant specie amounting to 155,624 (68%) followed by goats 68,972 (30%), pigs 3,015 (2%), sheep 574 (0.3%) and donkeys 353 (0.2%) (Chart 3.1).

Other livestock species were chicken 1,078,962, Ducks 34,279, rabbits 1,262, turkeys 881 and dogs 4,214. Out of the total chicken 932,469 were indigenous, 130,034 were layers and 16,459 were broilers.

The number of households keeping different types of livestock were as follows: those kept chicken were 80,069 (59%), cattle were 39,420 (29%), goats were 13,107 (10%) and ducks were

3,321(2%). However, households which reared sheep, pigs, donkeys, turkeys and rabbits were very few (Chart 3.2).

Table 3.2 summarizes production data for different types of livestock. Ducks, Turkeys, Rabbits and Donkeys are of relative minor importance. On average, households kept about four cattle, five goats, three sheep, thirteen chicken and 20 pigs. Very few households kept ducks, turkeys, rabbits, and donkeys. For example, an average of one donkey was kept per household.

Table 3.2: Number of Livestock by Type

Livestock Type	No. of Household	No. of Livestock	No. per Household
Cattle	39,420	155,624	4
Goats	13,107	68,972	5
Sheep	210	574	3
Pigs	153	3,015	20
Donkeys	296	353	1
Ducks	3,321	324,279	10
Turkeys	229	881	4
Chicken	80,069	1,078,962	13
Rabbits	198	1,262	6

Expressing livestock number in terms of livestock units (LSU), the results show that, there was an equivalent of 170,715 livestock units in total representing 228,538 major livestock of different

species (cattle, goats, sheep, pigs and donkeys).

Cattle livestock units were 155,624, goats 13,794, sheep 115, pigs 1,005 and donkeys 176 units. The LSU is used to estimate total quantity of livestock based on cow having a LSU of 1, a goat or sheep 1/5 LSU, a pig 1/3 LSU and a donkey 1/2 LSU.

3.1.1 Cattle Population

The total number of cattle raised in by the smallholders was 155,624 heads out of which, the indigenous type represented 95.5% of the total cattle population.

Table 3.3: Number of Households and Number of Cattle by Herd Size

Herd size	Cattle Rearing Households	%	Herd of Cattle	%	Average Per Houseold
1 - 5	31,627	80.2	83,610	53.7	2.64
6 - 10	6,001	15.2	43,716	28.1	7.28
11 - 15	1,232	3.1	15,662	10.1	12.71
16 - 20	331	0.8	5,797	3.7	17.52
21 - 30	148	0.4	3,704	2.4	25.09
31 - 40	51	0.1	1,736	1.1	34.00
41 - 50	30	0.1	1,398	0.9	46.00
Total	39,420	100	155,624	100	3.95

On average, the herd size of cattle per holding in the smallholder sector was 4 heads (Table 3.1). Of the total 39,420 cattle keeping households, 95.4 percent reared between 1 and 10 heads. Three percent of the households reared between 11 and 15 cattle while there were few households with more

than 15 cattle per household. Their range is between 18 and 46 heads per household (Table 3.3).

However, smallholders with fewer animals (1 to 5) raised more than half of the cattle population. Central district had the largest cattle population (27,662) followed by Micheweni (23,419), Wete (21,934) and West (21,132) (Chart 3.3, Maps 3.1 and 3.2). Other districts with relatively large number of cattle are Mkoani (16,976), Chakechake (15,982), North 'B' (15,677). Although North 'A' and South districts had

fewer numbers of cattle, the number of cattle per household was comparable to that of Wete district which had a large number of cattle population. South district had the least number of cattle compared to other districts (Chart 3.3). Highest cattle population density was in West and Wete (89 cattle per square kilometre), followed by Mkoani (22), Chakechake (70), North B (64). The lowest density was in South (12 cattle per Sq. Km) (Map 3.2).

Cattle population (both indigenous and exotic or their crosses) has increased by approximately 27 percent from about 111,693 heads in 1993 to 155,624 heads in 2008. However, in the period between 2003 and 2008, the total cattle population of the smallholder has decreased by 4.5% from 162,643 to 155,624 heads giving an annual negative growth rate of about

0.9 percent per annum over the five year period. The indigenous cattle population also has decreased from 154,381 to 148,744 heads representing a total decrease of 3.7% and a negative annual growth rate of 0.75% (Chart 3.4).

Indigenous Cattle Population

The cattle population is mainly dominated by the indigenous type 95.6%, while the improved dairy cattle contributed only 4.5 percent and no improved cattle for beef. The census results show a decrease in the number of indigenous cattle from 108,346 in 1993 to 148,744 heads in 2008 representing a 3.7 percent decrease (Chart 3.4).

Districts with more households rearing indigenous cattle include; Micheweni district reared (18.3%) followed by Wete (15.4%), Mkoani (14.8%) and Central district (12.1%). The same districts had more indigenous cattle than other districts (Charts 3.5 and Charts 3.6). Nevertheless, the following districts had moderate percentages of households with livestock: Chakechake (11.9%), West (11.6%) and North 'B' (8.2%). However, North 'A' (4.6%) and South (3.2%) districts had least number of households rearing indigenous cattle than other districts. In total, the indigenous cattle accounted for more than 90% of the entire cattle population in each district (Chart 3.6).

Improved Cattle Population

All of the improved cattle are of dairy type (100%) reared by 2,422 households and there were no improved cattle for beef. The Central district (Kati) had 730 households rearing dairy cattle representing 30.1

percent of the total households followed by West with 659 (27.2%), Wete with 487 (20.1%) and Chakechake with 248 (10.2%) households. North-B, North 'A', Micheweni, Mkoani and South districts had very few (less than 5%) households engaged in the rearing of improved dairy cattle (Chart 3.7).

In terms of numbers, the Central district had the highest population of dairy cattle amounting to 2,037 (29.6%), followed by West 1,790 (26%), Wete 999 (14.5%) and Chakechake 961 (14%). The contribution of North 'A' to the total number of improved dairy cattle was only 7.8%. North-B, Micheweni, Mkoani and South had the least number of improved dairy cattle (Chart 3.8, Map 3.3).

Over the past 15 years, the number of dairy cattle (pure or their crosses) has increased by 137% between 1993 and 2008 despite that the number of dairy cattle has declined by 13% between 2003 and 2008. In the overall, there was a two fold increase from about 3,337 heads in 1993 to 6,880 heads in 2008 representing an annual growth rate of 7% (Chart 3.9).

3.1.2 Goat Population

The total number of goats raised by smallholders was 68,972. Goat population increased from 45,115 in 1993 to 68,972 in 2008, representing an increase of about 53 percent and an annual

growth rate of 3.5% over the 15 years period (Chart 3.10). Between 1993 and 2003, the percentage increase was 16% while the growth has doubled to 32% between 2003 and 2008.

The average number of goats per household was 5 goats. Most of the households (90.5%) raised between 1 to 9 goats representing 60.7% of the total goat population. The remaining households (9.5%) raised 39.4% of the goats (Table 3.4).

Table 3.4: Number of Households Raising Goats by Herd Size

Herd Size	Households		Goat		Number Per Household
	Number	Percent	Number	Percent	
1 - 4	8,372	63.9	20,734	63.9	2
5 - 9	3,486	26.6	21,131	26.6	6
10 - 14	826	6.3	9,369	6.3	11
15 - 19	163	1.2	2,536	1.2	16
20 - 24	58	0.4	1,289	0.4	22
40+	202	1.5	13,914	1.58	69
Total	13,107	100	68,972	100	5

With regard to households raising goats a total of 13,107 households were reported to managed goats. Central district had more households (17%) followed by Mkoani and Micheweni with 14 percent each, West (13%), North 'A' (11%), and

Chakechake(10%). Other districts with lower percentages are North 'B'(9%), South (6%) and Wete (6%) (Chart3.11). The leading districts with more goats include Central with 16,415 (24%), West with 12,026 (17%) and North 'A' district with 8,222 (12%) ((Table 3.4 & Map 3.4).

Cattle Population
Density per Sq. Km.**

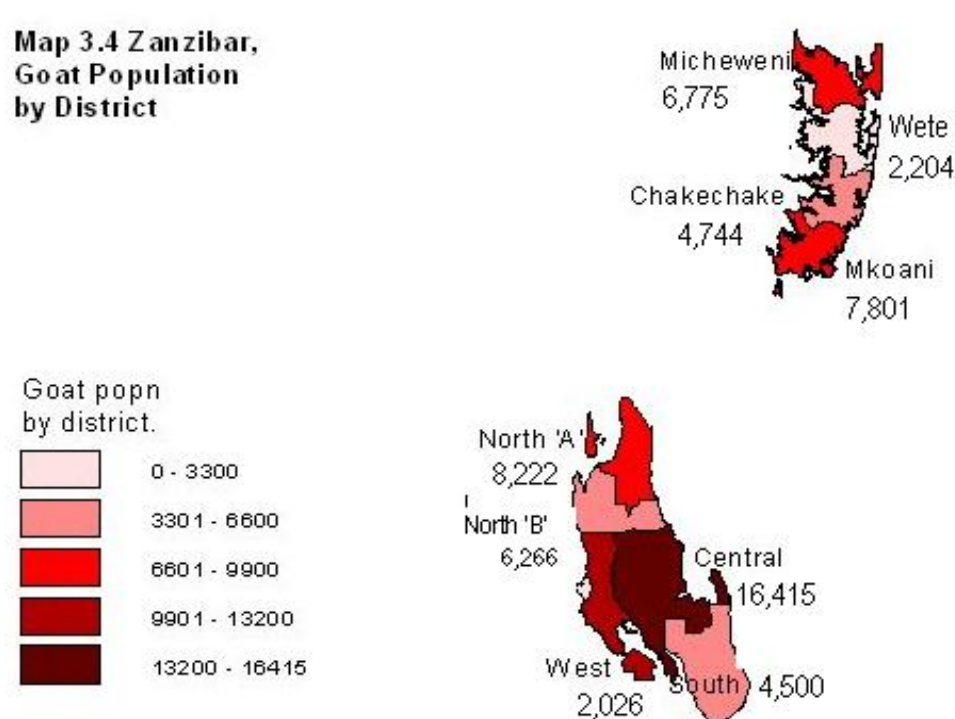

Cattle population
per Sq. Km

**Map 3.3 Zanzibar,
Dairy Cattle Population
by District**

**Map 3.4 Zanzibar,
Goat Population
by District**

The districts of South, Chakechake and Wete had the least numbers of goats. Out of 13,107 agricultural households rearing goats, 12,817 (97.8%) households reared indigenous goats, 444 (3.4%) households kept improved goats and only 32 (0.24%) households kept improved goats for meat. Highest goat densities were found in West, South and Central (51 goats per Sq. km). Others were North (34), Mkoani (34) and Micheweni (25). Wete district had the lowest goat concentration of only 9 goats per Sq. km (Map 3.5).

The number of indigenous goats was 57,004 (82.6%), improved dairy goats 11,905 (17.3%) and 63 (0.1%) improved goats for meat. In total the number of improved goats (Improved for meat and Improved dairy) was 11,968 or 17.4% of the total goat population. Most of the improved goats were in the Central district (7,721), West district (1,947) and North 'A' district (1,890). However, the districts of South, North-B, Micheweni and Mkoani had no improved goats (Chart 3.13, Map 3.6)

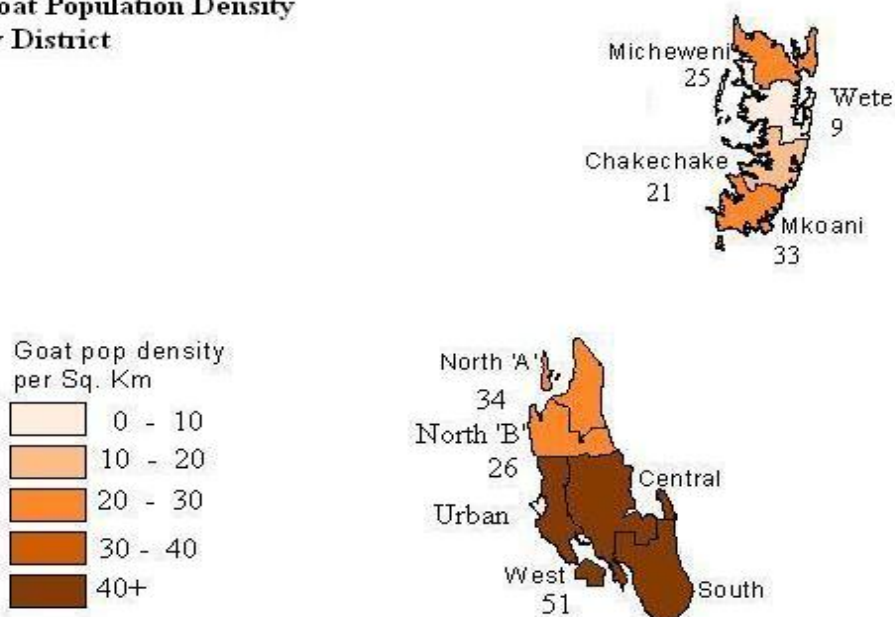

3.1.3 Sheep Population

Sheep keeping is insignificant in Zanzibar with only 210 households engaged in sheep rearing. All the reared sheep were of indigenous type. Most of the sheep were found in five districts namely: West (49%), Central (21%), Micheweni (15%), North 'B'(9%) and North 'A' (6%) (Chart 3.14). The average number of sheep per household rearing sheep was 3.

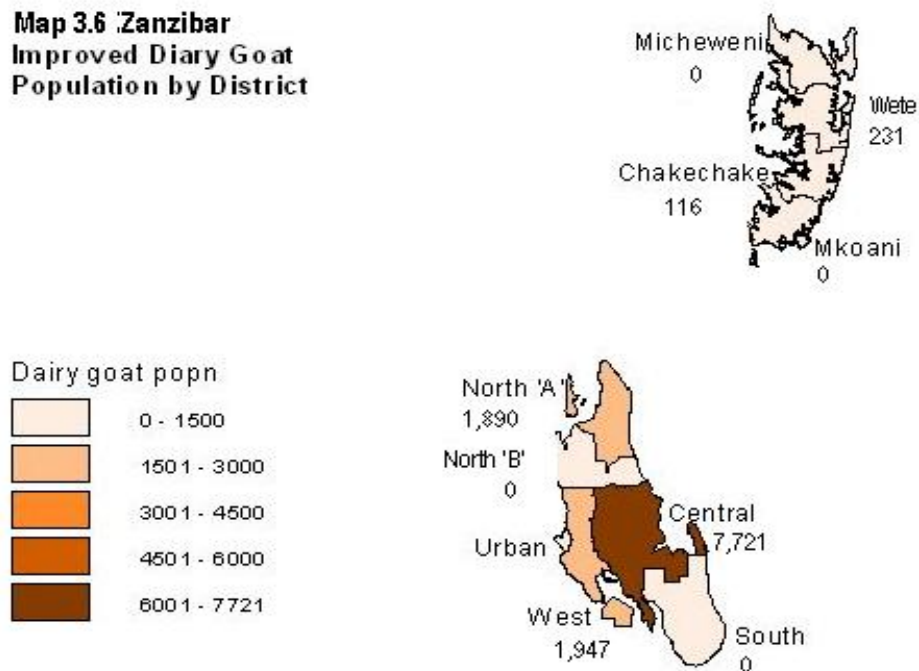

Unlike goat population which increased between 1993 and 2003, sheep population declined by 53 percent in the same period. However, the trend was reversed between 2003 and 2008, whereby the number of sheep increased from 300 to 574 representing a 91 percent increase. On the overall, the annual growth rate over the 15 years period was only 0.6 percent (Chart 3.15).

Map 3.5 Zanzibar
Goat Population Density
by District

Map 3.6 Zanzibar
Improved Dairy Goat
Population by District

3.1.4 Pig Population

The number of pigs as by 1st October, 2008 was estimated to be 3,015 heads. These were kept by 153 households, representing an average of 20 pigs per household. Almost all the pigs were kept in the South Unguja and Urban West regions (62.5%) in the central district and (37.5%) in the West district. About 40 percent of the households kept between 5 and 9 pigs, 20 percent kept between 15 and 19 pigs and the remaining 40 percent of the households raised between 30 and 39 pigs. Moreover, most of the pigs (67.7%) were raised by 40 percent of the households in the category of 30-39 pigs.

In this cluster, the average number of pigs per household was 33 heads (Table 3.5). In total, the average number of pigs per household was 20. Also, over the fifteen years period, the pig population has increased dramatically from 66 heads in 1992/1993 to 3,015 heads in 2007/2008. This represents an increase of 4,468 percent with an average annual growth rate of 298 percent (Chart 3.16).

Table 3.5: Number of Households Raising Pigs by Herd Size

Herd Size	Pig Rearing Households		Herd of Pigs		Average per HH
	Number	%	Number	%	
5 - 9	61	40	395	13.1	6.5
15 - 19	30	20	578	19.2	19.0
30 - 39	62	40	2,042	67.7	33.0
Total	153	100	3,015	100	19.7

3.1.5 Chicken Population

Many households in Zanzibar keep chicken especially the indigenous ones or their crosses with either layer or broiler types (hereafter referred to as local). The census results show that 80,069 households equivalent to 60.6 percent of all the agricultural households were engaged in poultry keeping. These households kept 1,078,962 chickens of which 86.4 percent were indigenous, 12.1 percent were layers and 1.5 percent were broilers. More households in Wete, West, Micheweni and Mkoani districts kept chicken compared to other districts (Chart. 3.17).

**Map 3.7 Zanzibar,
Sheep Population
by District**

**Sheep Population by
District**

**Map 3.8 Zanzibar
Pig Population
by District**

**Pig Population
by District**

In terms of number of chicken, West district kept 21 percent of the total chicken population. Other districts with relatively high population of chicken were Wete, Mkoani and North 'B' (Chart. 3.18 and Map 3.10) whereas South and North 'A' districts had the least number of chicken.

About 75 percent of the total chicken population was kept by 96.9 percent of the households whereby the flock size was in the range of 1 to 49. These were mainly indigenous/ local types (Table 3.6).

The remaining 25 percent of the chicken were kept by 2,438 (3%) of the total chicken raising households. The average number of chicken per household was 13. However, the number of chicken has increased from 790,089 to 1,078,962 (an increase of 36.6 percent) over the 15 years period (1993 to 2008) (Chart 3.19).

Table 3.6: Households Raising Chicken by Flock Size

Flock Size	Number of Households	%	Number of Chicken	%
1-49	77,631	96.9	804,726	75
50-99	1451	1.81	86,245	8
100-299	842	1.05	124,647	12
300-499	114	0.14	38,225	4
700+	31	0.04	25,120	2
Total	80,069	100.00	1,078,962	100

average growth per annum over the 15 years period (1993 to 2008) (Chart 3.20).

About 98 percent of the local chicken keeping households kept less than 50 birds per household and the households had a chicken population of 76,731 or 85 percent of the total local chicken . Only about 2 percent of the households kept more than 50 chicken per household which represented 15 percent of the total chicken population. However, there was no household with 500 or more local chicken (Table. 3.7).

Indigenous Chicken Population

There were 932,469 or 86% of the total indigenous chicken. The number has increased from 712,473 in 1992/1993 to 932,469 in 2007/08, an overall increase of 31% and a 2% average growth per annum over the 15 years period (1993 to 2008) (Chart 3.20).

**Table 3.7: Households Raising Local Chicken by Flock Size**

Flock Size	Indigenous chicken			
	Number of Households	%	Number of Indigenous Chicken	%
1-49	76,731	98	795,432	85
50-99	1,306	2	76,320	8
100-299	359	0	50,537	5
300-499	25	0	10,180	1
700+	0	0	0	0
Total	78,422	100	932,469	100

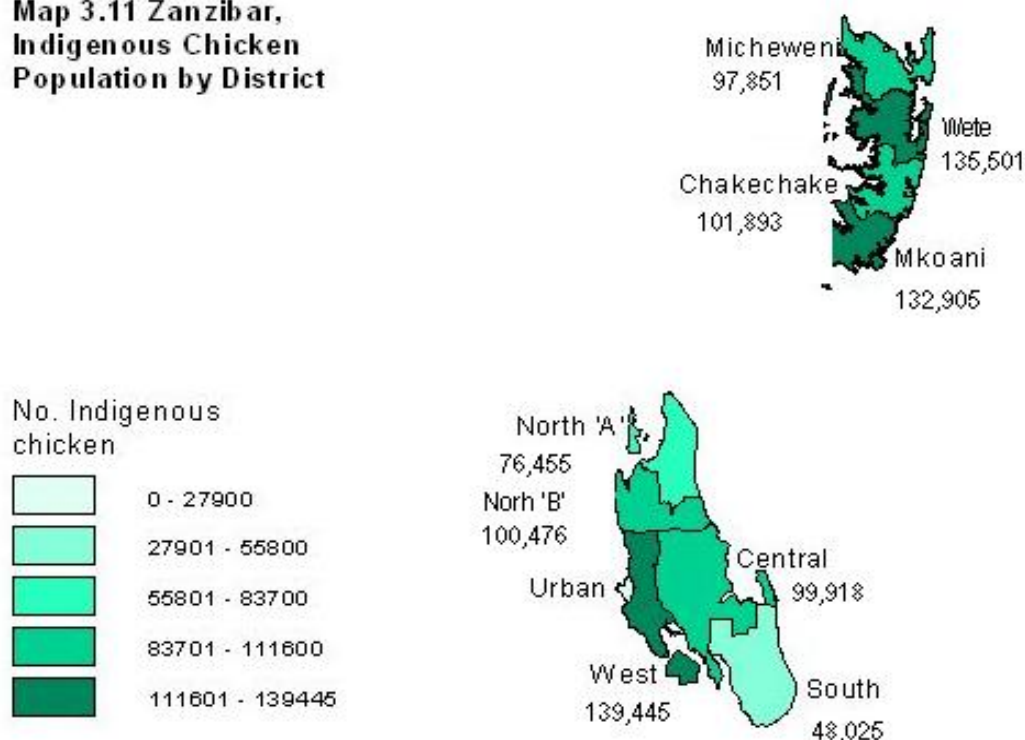

Most of the indigenous chicken were kept in

West, Wete and Mkoani districts. Other districts with about 10% of the populations include North-B, Central, Micheweni and Chakechake while. South district had the least number of indigenous chickens (Chart 3.21 and Map 3.11).

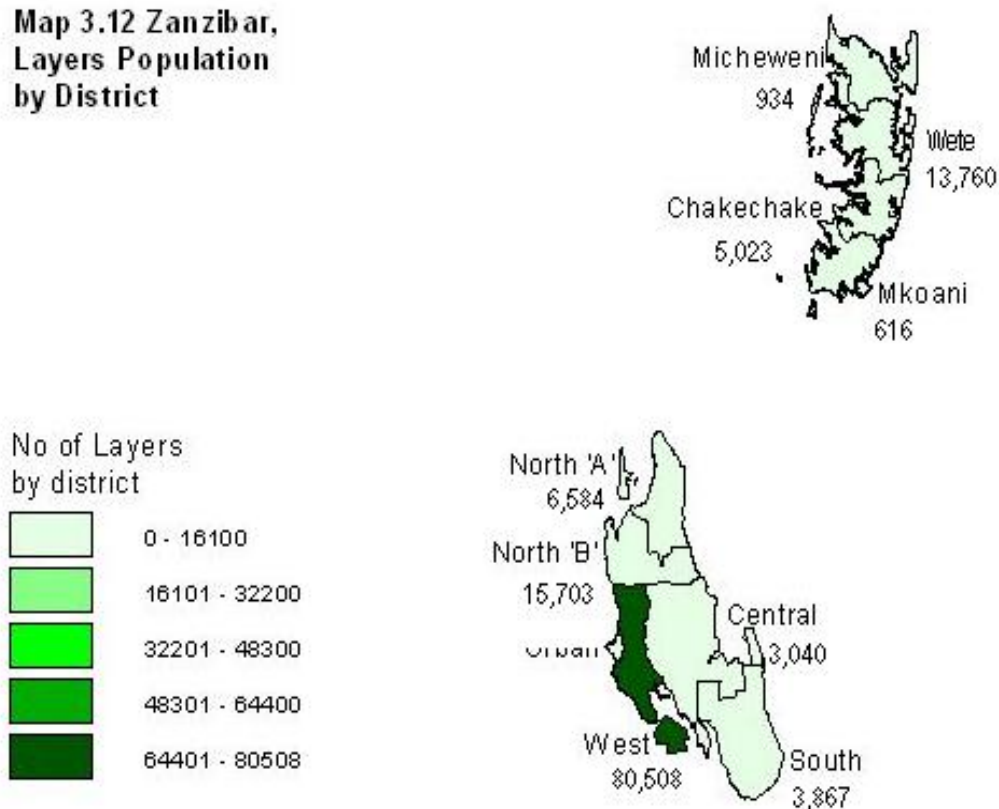

Improved Chicken Population

The number of improved chicken in the smallholder sector is relatively small. The survey results show that there were about 146,493 chicken representing 13.6 percent of the total chicken population. About 12.1 percent of the improved chickens were layers and 1.5 percent was broilers.

**Map 3.11 Zanzibar,
Indigenous Chicken
Population by District**

**Map 3.12 Zanzibar,
Layers Population
by District**

The number of layers increased from 35,712 in 1992/1993 to 130,034 in 2007/2008 an increase of 264 percent, while the number of broilers decreased from 41,904 to 16,459 a decrease of 60.7 percent (Chart 3.22).

Most of the layers and broilers were kept mainly in the West district followed by North 'B' district, Wete and North 'A' (Chart 3.23, Map 3.12).

The 52 percent of the household that kept layers raised between 1 and 49 chicken; however, this cluster raised only 5.6 percent of the total layer population. About 29 percent of the households kept between 100 and 299 birds representing 45.8 percent of the total number of layers. Almost two thirds of the households kept broilers,

and the flock size ranged between 1 and 49 birds. The remaining one third kept 88 percent of the broiler population (Table 3. 8).

The percentage of layers in West and North B districts were relatively higher at about 62percent and 12percent respectively. The remaining districts had a total contribution of 26percent of the improved layer population (Chart 3.24). North 'B' and West districts had the highest concentration of broilers with contributions of 30.9 percent and 57.2 percent respectively. Districts of South, Central, Wete, Chakechake and Mkoani had no broilers or their percentage contributions were negligible.

Table 3.8: Improved Chicken Population by Flock Size

Flock Size	Layers				Broilers			
	Number of Households	Number of Layers	%	Number of Chicken Per Household	Number of Households	Number of Broilers	%	Number of Chicken Per Household
1-49	721	7,345	5.6	10	179	1,949	12	11
50-99	145	9,925	7.6	68	0	0	0	0
100-299	394	59,600	45.8	151	88	14,510	88	164
300-499	88	28,045	21.6	318	0	0	0	0
700+	31	25,120	19.3	800	0	0	0	0

3.1.6 Other Livestock

Other livestock includes ducks, guinea pigs, turkeys, rabbits and donkeys. They are less important to the overall contribution to household food security and are kept by fewer households. Proportionally, there were more ducks compared to other livestock types and donkeys were the least in the population. Donkeys are mainly used as pack animals. Most of the ducks and rabbits were found in West district with contributions 47 percent for ducks and 57percent for rabbits, while guinea pigs were more in North B and Central districts and donkeys were concentrated more in Chakechake district (Table 3.9).

Table 3.9: Population of Other Livestock by District

District	Ducks	%	Guinea pigs	%	Turkeys	%	Rabbits	%	Donkeys	%
North 'A'	6,332	18	0	0	0	0	0	0	63	18
North-B	4,556	13	331	40	305	35	0	0	0	0
Central	2,097	6	213	26	122	14	0	0	30	9
South	1,803	5	81	10	244	28	97	8	0	0
West	16,077	47	0	0	157	18	722	57	0	0
Wete	1,589	5	0.	0	0	0	256	20	51	15
Micheweni	555	2	175	21	0	0	0	0	0	0
Chakechake	922	3	23	3	0	0	186	15	155	44
Mkoani	348	1	0	0	54	6	0	0	54	15
Total	34,279	100	823	100	881	100	1,262	100	353	100

However, more households kept ducks than any other species (Table 3.10). The average number of ducks per household was 10 while the average number of turkeys, rabbits and donkeys per household were 4, 6 and 1 respectively.

Table 3.10: Number of Households and Livestock by Type

Type of Livestock	Number of Household	Number of livestock	Average number per HH
Ducks	3,321	34,279	10
Turkeys	229	881	4
Rabbits	198	1,262	6
Donkey	296	353	1
Others	1839	5037	3

3.2 Livestock products -Milk Production

Most of the milk is produced from cows. In Zanzibar there was a total of 44,718 cows milked during the wet season (6.5% improved type; 93.5% indigenous type) and 36,639 cows during the dry season (7.6 % improved type; 92.4% indigenous types). The total milk production during the wet season was 111,616 lt and dropped to 84,385 lt during the dry season. The average milk production was 2.5 liters during the wet season and 2.3 lt during the dry season. West district ranked highest in total production (both during the wet and dry season (23 and 27% of total production respectively). It was followed by Central (19%), Wete (13%) and North B (14%). The four districts produced about 69% of total milk during the wet season. Other district produced moderate amount of milk and the least were North A and Mkoani (Table 3.11, Map 3.13).

Table 3. 11: Total Milk Production and Percentage by District

The average milk production per cow per day was 7 liters and 2 litres for improved dairy type and local type during both the wet and dry season respectively. However, highest production during the two seasons was recorded in North A and West for improved types with average of 12 and 10 litres respectively. Milk production from

District	Wet season (Lt)	Percet	Dry Season (Lt)	Percent
North 'A'	9623	9	7225	9
North 'B'	15298	14	11779	14

Total	111616		84385	

indigenous cows did not differ much between district and ranged from 2 to 3 litres per day during the wet season. During the dry season the range in milk production per cows was between 1 and 2 litres per day (Table 3.11). The disparity between district for improved type could be linked to type of improved animals (exotic blood levels), and management.

The price of milk varied between districts, seasons and type of animals. During the wet season the average price of milk from improved cattle was slightly higher than that from indigenous cattle, being 507 Tsh and 479 Tsh respectively.

Table 3.12: Average Milk Production per Cow per day, by Category of Cow, Season and District

District	Wet Season			Dry Season		
	Improved Breed	Indigenous	Total	Improved Breed	Indigenous	Total
	Mean (ltr)	Mean (lts)	Mean (lts)	Mean (lts)	Mean (lts)	Mean (lts)

Total	7	2	2.5	7	2	2.3

The same pattern was observed during the dry season, whereby milk from improved cattle increased to 522 Tsh (2.9% increase), while that of indigenous cattle was 495 Tsh (an increase of 3.3%) (Table 3.12). During the wet season, highest price per litter was recorded in North A (570 Tsh) followed by Wete (507 Tsh), West (502 Tsh) and Mkoani (501 Tsh). For the remaining districts the prices were near equal ranging from 449 Tsh to 491 Tsh in South district. Near similar pattern was displayed during the dry season, North A leading in the price charged per liter. For both season lowest price were found in central district with price being 450 Tsh and 461 Tsh respectively.

Milk production from goats was insignificant. A total of 1018 litres were estimated to be produced during 2007/08 agricultural year from 880 goats each producing on average about 1.2 litres per day. The price of goat milk was however, higher than that of cow's milk, being 903 Tsh on average (Table 3.13).

During Wet Season
by District**

Milk Production by District

3.3 Contribution of Livestock to Crop production

In addition to provision of milk and draught power, livestock has important contribution to crop production in terms of manure provision. In Zanzibar, a total of 6,806 households (7.7% of all households planting during Long rain) use organic fertilizers (mainly manure). Organic fertilizer was used on 2,926 ha representing 7.8 percent of the total planted area during long rain season (MASIKA) (Table 3.14).

Districts with higher proportion of area planted with organic manure were Central (21.7%), South (16.5%), North B (14.1%) and West (13.7%). Uses of organic manure in other districts were less than 10 percent of planted area during long rain, the least being Mkoani (3.2) and Chakechake (1.9%) (Table 3.14). The extent of fertilizer use does not match with the number of livestock kept. For example, Michweni and Wete ranked second and third respectively in terms of number of cattle, but were among the lowest user of organic fertilizers.

Table 3.14 Animal Contribution to Crops: Number of Households and Planted Area by Organic Fertilizer use and District - Long Rainy Season

3.4 Livestock Diseases and control

3.4.1 Common Livestock Diseases

The most common diseases infecting ruminant livestock include Tick Borne Diseases (T.B.D), Foot and Mouth Diseases and Lumpy Skin Disease (LSD), while in poultry, the Newcastle disease and Fowl Typhoid were the most challenging. Newcastle disease infected 53,530 households and these presenting 59 percent of the total livestock rearing households (91,380).

The number of households reporting Fowl Typhoid, infection was 20,036 representing 22 percent of the total livestock rearing households. The number of households rearing livestock reported to be infected by Tick Borne Disease were 30,121 (33%), Lumpy Skin disease 7,834 (9%), and Foot and Mouth Disease (FMD) 4,513 (5%) of the total households rearing livestock (Chart 3.25).

Lumpy Skin Disease (LSD)

A total of 7,834 (9%) cattle rearing households have reported to have been affected by the Lumpy Skin Disease. The highly infected districts with the disease were: Central with 1,763 (23%) households, this followed by West with 1,664 (21%) households, Wete district accounted 1,127 (14%) households rearing livestock. Fewer incidences of the

disease were in North 'A' district where only 4 percent of the households reported to have been affected by the disease. About nine and seven percent of the households in Micheweni and Chakechake districts reported the incidences respectively. South and Mkoani districts had three and nine percents of cases of the cattle keeping households. In Wete district, 1,127 households rearing livestock equivalent to 14 percent of the cattle keeping households were affected with the LSD (Chart 3.26, Map 3.15).

Tick Borne Disease

Incidences of Tick Borne Disease (TBD) were highest reported in Central district with 4,377 households or 48 percent of the households rearing livestock within the district. Chakechake district had 4,201 (39%) cases followed by Micheweni district with 4,585(36%) reported cases within the district. Other districts with moderate cases were Mkoani district with 3,981(34%) cases,

Wete district with 4,254 (33%) cases and North 'B' district with 2,672 (33%) cases (Chart 3.27, Map 3.16).

Worm Problems

The distribution of households reporting worm problems (Helminthosis) is presented in Map 3.17. There were more household encountering worm problems in West, followed by Central district. Other districts with moderate intensity were North A, North B, Micheweni and Wete. Mkoani reported fewer incidences of worms.

Tse tse problems

Although there were programmes to eradicate Tsetse in Zanzibar, the 2007/08 agricultural census still indicate that the problem still exist. Map 3.18 shows that In Pemba Island there were more tse tse cases than in Unguja island. Mkoani district had higher number of households reporting Tsetse problems (714), It was followed by Micheweni (555 hh), Chakechake (403 hh). In Unguja more incidences were reported in West (471 hh), North A (410 hh) and Central (304 hh) (Map 3.18).

Foot and Mouth Disease

Foot and Mouth Disease was one of the serious diseases which was reported to infect 4,513 (10%) of the total households rearing livestock. The highly infected districts include Central with 1,216(14%) households and West district with 1,507 (12%) households. South and North 'B' districts had few households reporting to encountered Foot and Mouth Disease with only 6 percent and 7 percent respectively. Incidences of FMD were the least in Wete and Chakechake districts, each with one percent followed by North 'A' (3%). In Micheweni and Mkoani districts only 2 percent of the cattle rearing households reported the FMD cases in each of the districts (Chart 3.28, Map 2.22).

Newcastle Disease

Newcastle is one of the serious poultry disease which affected 53,530 households or 59 percent of the total livestock rearing households. The leading districts were, Chakechake with 7,875 households or 74 percent, North B with 5,650 or 67 percent, West and Wete districts, each with 63 percent, Central (58%), North A (49%), Micheweni (48%), Mkoani and South districts, each with 47 percent of the households (Chart 3.29, Map 3.19).

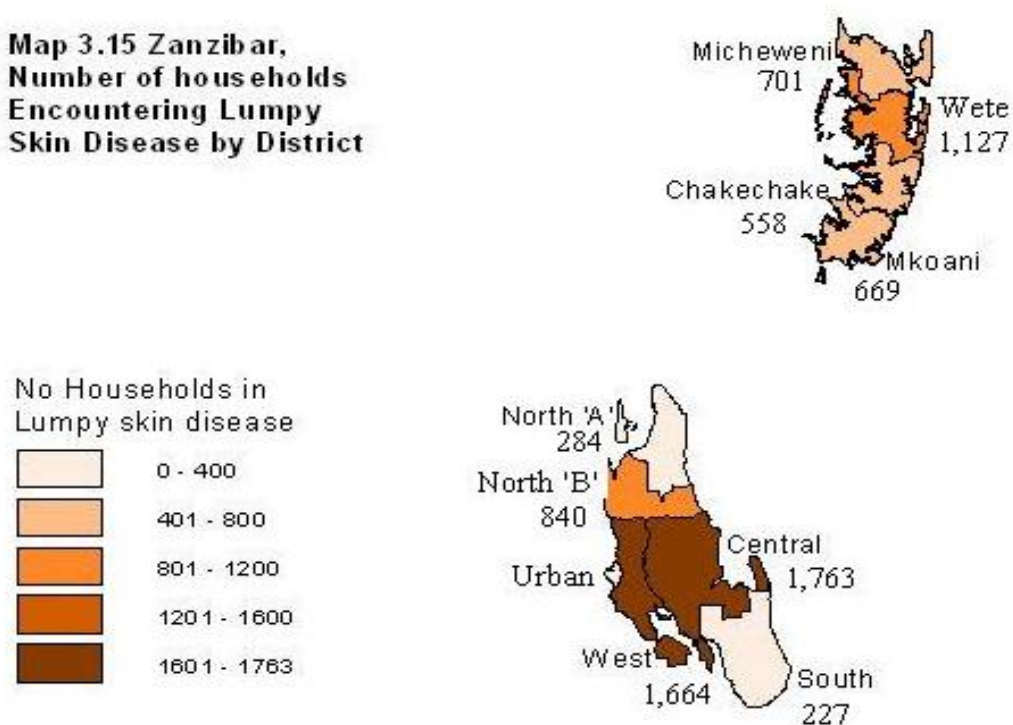

South districts, each with 47 percent of the households

Fowl Typhoid Disease

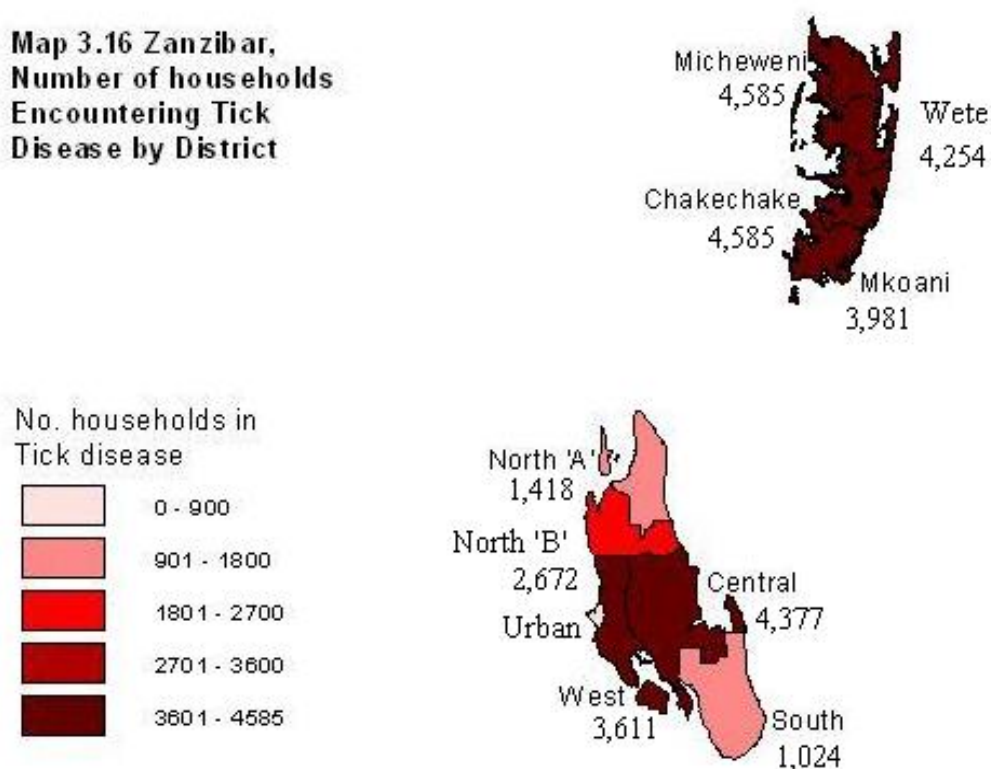

Fowl Typhoid was reported by 20,036 households or 22 percent of the total livestock rearing households. The highest incidence of the problem was reported in Wete of which 3,895 (31 %) of the total households rearing livestock within the district encountered the problem and was followed by West district (30%). The disease was moderately encountered in Micheweni district (24%), Chakechake (23%) and North B (21%). Less than 15% of the cases were reported in the districts of Central (14%), South (12%) and North 'A' (12%) (Chart 3.30, Map 3.20).

3.4.2 Livestock Disease Control Methods

The livestock pest control methods focused on Tick problem, Newcastle, Disease and Fowl Typhoid. Livestock diseases were observed in almost all the surveyed districts, with some districts reporting more incidences of particular diseases than in other districts. Since diseases occurrence varies by types of livestock there are different control methods for such diseases. This section presents in detail various control methods by type of the Diseases, Type of the Methods and by District.

Tick Control Methods

Tick borne disease was reported as being the most serious disease infecting ruminants in Zanzibar. The disease was most notorious in Central, Chakechake and Micheweni. The severity of the disease was reported as moderate in Mkoani, Wete, and North B, and low in North A, South and West. Among the Tick control methods reported, spraying was the most commonly method applied by 19 percent of the households in Zanzibar followed by Smearing applied by 8 percent of the livestock raising households. Dipping and other methods accounted to 4 and 2 percents respectively of the livestock raising households applying the method (Table 3.11).

There were also variations in the application of these methods by district. Spray methods was practised in all the districts; however the method was most practised in Chake (26%), Central (23%), South (21%), and Mkoani (20%). Smearing was the second most applied tick control method especially in Central (19%), and West (15%). The method was moderately applied in Wete (8%), North B (7%); lowly applied in Micheweni and Chake chake by 5 percent each. Dipping was the least applied method by all the districts in livestock raising households applying the method. There is however the largest percentage (66%) of the livestock raising households reported not to apply any control methods against tick borne disease across the nine surveyed districts (Table 3.15).

Table 3.15 Number and Percentages of Livestock Raising Households practicing various Tick Control methods by District

District	Dipping		Spraying		Smearing		None		Other		Total	
	Number	%	Number	%	Number	%	Number	%	Number	%	Number	%

Total	4,024	4	17,304	19	7,607	8	61,380	66	1,994	2	92,309	100

Newcastle Control Methods

Newcastle problem was a notorious problem which affected poultry. In Zanzibar, incidences of the disease were reported as severe in Chakechake and North B districts, followed by West and Wete with the remaining districts reporting the disease incidence as moderate and slightly severe. The Newcastle control methods practised in

Zanzibar were use of Local herbs, practised by 15 percent of the poultry raising households, and vaccination practised by 10 percent of the poultry raising households. Seventy five percent (75%) of the poultry raising households reported not to have practised any Newcastle control methods (Chart 3.31).

The application of these two control methods against the Newcastle problem varied from district to district. Local herbs, which was most popular control method in all the districts, was highly practised in North A and South, at 21 percent of the livestock raising households in each of the two districts followed by Central and West districts with 19 percent of livestock raising households in each district. The method was also practised by only 12 percent in each of the livestock raising households of North B, Wete, and Micheweni districts. The method was least practised in Chakechake (9%) followed by Mkoani (10%).

Vaccination was widely used in West (18%) followed by Central (13%) and moderately used in Wete (11%), Mkoani (10%), and North (9%). The method was less used in North B, South, Wete, and Chakechake districts where only 7 percent of the livestock raising households in each of the districts reported to have been applying vaccination (Chart 3.31).

On the whole, the application of vaccination against the Newcastle disease was not as popular as the local herbs and that the districts which applied local herbs most of them had low percentages of livestock raising households using vaccination against the disease. The vice versa was however not the case because the districts with high percentages of livestock raising households which applied vaccination were not necessarily the ones which had low application of local herbs. Therefore, the trend implies that the local herbs were considered as the best alternative, and vaccination was considered as a supplementary method. Generally, Chakechake district had the highest percentage (84%) of households not practicing any Newcastle control method, followed by North B (81%), Mkoani and Wete districts each represented by 80 percent, Micheweni (77%), South (72%), North A (69%), West (68%) of the livestock raising households not to have applied any Newcastle control method (table 3.16 and Chart 3.31).

Table 3.16 Number and Percentages of Livestock Raising Households which Practiced Newcastle Control Methods by District

District	Vaccination		Local Herbs		None		Total	
	Number	%	Number	%	Number	%	Number	%
North 'A'	851	9	1,953	21	6,300	69	9,104	100
North-B	611	7	993	12	6,871	81	8,475	100
Central	1,186	13	1,733	19	6,232	68	9,150	100
South	276	7	877	21	2,957	72	4,110	100
West	2,386	18	2,512	19	8,446	63	13,345	100
Wete	948	7	1,589	12	10,224	80	12,761	100
Micheweni	1,372	11	1,606	12	9,928	77	12,907	100
Chake	760	7	992	9	8,898	84	10,650	100
Mkoani	1,205	10	1,205	10	9,398	80	11,808	100
Total	9,594	10	13,459	15	69,255	75	92,309	100

Fowl Typhoid Control Methods

Fowl typhoid was another disease that affected poultry in Zanzibar. The incidences of the disease were reported as severe in Wete, West districts; and moderately in Micheweni, Chakechake and North B districts. Low incidences of the disease were reported in North A, South, Central and Mkoani districts. The control methods for Fowl Typhoid included prophylactic treatment and use of local herbs. Local herbs were more widely practised than vaccination or any other therapeutic approaches against Fowl Typhoid.

Local herbs were reported to be used by 8,560 households or 9 percent as compared

to 2,971 or 3 percent of the poultry raising households. It is apparent that the number of poultry raising households which applied Fowl Typhoid Control Methods was much lower than that which applied Newcastle Control Method. This implies that the Newcastle disease affected more poultry raising households than did the Fowl Typhoid. This situation is also reflected by higher numbers and percentages of poultry raising households which reported not to have used any Fowl Typhoid Control Methods (Chart 3. 33, Table 3. 13).

The trend of application of the Fowl Typhoid Control Methods by District and by Method Type indicates that Local Herbs was more widely applied in all the districts. However, West had the highest percentage (12%) of the households which applied Local Herbs, followed by Wete and Micheweni districts, each with 11 percent of the households. The method was moderately applied in the districts of North A (10%), South (9%), Mkoani and Central, each with 8 percent, Chakechake (5%) and North B (6%) (Chart 3.36, Table 3.17).

Table 3.17: Number and Percentages of LRHH which Practiced Fowl Typhoid Control Methods by District

Mkoani	268	2	991	8	10,550	89	11,808	100
Total	2,971	3	8,560	9	80,809	88	92,339	100

3.4.3 Deworming Practices

Deworming was generally practiced in all the districts for cattle, goats, sheep, pigs, and chicken. There was however some variations on the extent of the practice by district and by type of livestock. Deworming was practiced in the districts as follows: Central (52%), West (45%), North B (31%), North A (29%), Chakechake (28%), South (27%), Wete (24%), Micheweni (24%) and Mkoani (19%) of the total livestock rearing households with the districts (Chart 3.34).

Deworming of Cattle

Deworming of cattle was practiced by households in all the districts. A total of 17,084 households were reported to dewormed cattle and this represents 60.8 percent of the total household that dewormed livestock. Deworming was mostly practiced in Central and West districts with 19.4 and 16.7 percents respectively. This was followed by Micheweni (13.3%) and Wete (12.1%).

Deworming was moderately practiced in the districts of Chakechake by (11.2%) and Mkoani (9.7%) Deworming of cattle was lowly practiced in the districts of South with (3.6%), North 'A' (5.7%) and the least district was North 'A' with only 5.7 percent of the total household deworming cattle (Chart 3.35).

Deworming of Goats and Sheep

Deworming was practiced for goats sheep in all the districts. The result reveals that a total of 4,109 households reported to dewormed Goats/sheeps and this represent 15 percent of the total livestock rearing households deworming livestock. However, deworming for goats/sheep was mostly practised in Central 912 (22%), West 691(17%), North 'B' 534(13%), Chakechake 457(11%) and

this was followed by Micheweni with 409(10%). The method was moderately practiced in North 'A' 347(8%), Wete (6%) and Mkoani (5%) (Chart 3.36, Table 3.18).

Deworming of Pigs

Deworming of Pigs was practiced by only two out of nine of the surveyed districts. A total of 122 households rearing pigs were reported to deworm pigs and this represent 80 percent of the total pigs rearing households. The districts which practised deworming of pigs include; Central and West. All households rearing pigs in West district were reported to deworm pigs. In Central district the deworming pigs households accounted for 75 percent, the remaining 25 percent within the district were reported not to deworm pigs (Table 3.19).

Table 3.18: Number of Goats/Sheep Rearing Households which Dewormed Goats/Sheep by District

District	Deworming Goats/Sheep		Not Deworm Goats/Sheep		Not Applicable		Number of Goats/Sheep Rearing households

Total	122	80	31	20	153	100

Deworming of Chicken

Chicken deworming was found to be a common practice by most of the chicken raising households in all the districts. The practice was however, more popular in West of which 3,360 household (27%) and Central with 1885 (15%) of the total household dewormed chicken. The practice was moderately practiced in North B and North 'A' with 1,222 (10%) and 1481(12%) of the households respectively. Mkoani had 1,151 (9%), Wete (10%), Chakechake (6%) and the least district was South with 487(4%) of the chicken raising households that dewormed. (Chart 3.38, Table 3.20).

Table 3.20 Number of Livestock Rearing Households which Dewormed Chicken by District

Mkoani	1,151	9	1,205	8	295	6	2,651

3.5 Bee Keeping

Bee keeping was also practised in Zanzibar, but not as widely as in the Mainland. Only one percent of the total agricultural households were involved in honey production. District-wise, South and Micheweni districts had the highest percentages of households involved in honey production at 3.7 percent and 2 percent respectively. Honey production was moderately practised in Mkoani (1.7%), Wete (1.2%), Chakechake and Central each with 0.7 percent, North B and West, each with 0.2 percent of the total agricultural households within the districts. However, the activity was reported not to have been practised in North A (Table 3.21).

Table 3.21: Number of Agricultural Households Involved in Honey Production by District

District	Agricultural Households Involved in Honey Production/Collection		Agricultural Households NOT Involved in Honey Production/Collection		Total	
	Number	%	Number	%	Number	%
North 'A'	0	0.0	18,901	100.0	18,901	100.0
North-B	25	0.2	11,427	99.8	11,452	100.0

West	31	0.2	18,620	99.8	18,651	100.0
Wete	179	1.2	15,195	98.8	15,374	100.0
Micheweni	350	2.0	17,170	98.0	17,520	100.0
Chakechake	93	0.7	13,742	99.3	13,835	100.0
Mkoani	268	1.7	15,931	98.3	16,199	100.0
Total	1,282	1.0	130,911	99.0	132,193	100.0

3.5.1 Beehives by Type of Bees

The survey results show that, there were a total of 87,725 beehives out of which, 62,797 (72%) were of improved type and the remaining 24,928 (28%) were local beehives, both types kept stingless and sting bees.

Chakechake had the highest percentage of improved beehives (97%) followed by Central (20%) and Mkoani (17%). Micheweni had the lowest percentage of improved hives (7%). As for local beehives, South, West and Wete districts had the highest percentage of local beehives of which all the beehives are locally made (100%) and kept both stingless and sting bees. Other district with highest percentage includes Micheweni and Mkoani with 93 and 83 percents respectively. The least proportion of number of local beehives was recorded in Chakechake district with (3%).

All the sting bees were kept in local beehives. West and Wete districts kept sting bees only. However, Micheweni was the second leading district with 69 percent of the total local beehives. Mkoani was the third leading district with 63 percent followed by South with 21 percent and Central with 20 percent of the local beehives (Table 3.22).

Table 3.22: Number of Beehives by Type and District

strict	Stingless Bees				Sting Bees				Total
	Improved Beehives		Local Beehives		Improved Beehives		Local Beehives		
	Number	%	Number	%	Number	%	Number	%	
North-B	0	0	0	0	0	0	0	0	0
Central	152	20	456	60	0	0	152	20	760
South	0	0	12,055	79	0	0	3,249	21	15,304
West	0	0	0	0	0	0	628	100	628

Chakechake	62,007	97	0	0	0	0	1,860	3	63,867
Mkoani	375	17	428	20	0	0	1,366	63	2,169
Total	62,797	72	13,844	16	0	0	11,084	13	87,725

3.5.2 Quantity of Honey Harvested and Average Prices

The quantity of honey harvested from sting bees was slightly higher (22,262 lts or 54%) than that harvested from stingless bees (19,087 lts or 46%). Also, the quantity of sting bees honey sold was slightly higher (17,807lt or 51%) than that sold from stingless bees (17,084lt or 49%). This imply that the quantity of honey harvested was directly proportional to the quantity of honey sold; that is, the higher the quantity harvested the higher the quantity sold (Table 3.19).

On average, honey from Chakechake was the highest priced (at Tshs. 9,999 per litre) than that from other districts; the second highest priced honey was sold in West (at Tshs. 8,000 per litre). Micheweni, Mkoani and South districts sold their honey at moderate prices of Tshs. 7,612 per litre, Tshs. 7,510 per litre, and Tshs.6, 651 per litre respectively (Table 3.23).

Table 3.23: Quantity of Honey Harvested and Sold by Type of Bees and District

District	Stingless Bees				Sting Bees				Total	
	Honey Harvested		Honey Sold		Honey Harvested		Honey Sold		Honey Sold (lts)	Honey Harvested (lts)
	Quantity (lts)	%	Quantity (lts)	%	Quantity (lts)	%	Quantity (lts)	%

Total	19,087	46	17,084	49	22,262	54	17,807	51	34,890	41,349

Table 3.24: Average Prices of Honey (Tshs /litre) by Type of Bees and by District

The price of honey was lowest in North B and was sold at Tshs. 3,000 per litre, followed by Central and Wete districts which sold their honey at Tshs. 3,500 per liter and Tshs. 4,429 per litre respectively.

On average, honey from stingless bees was sold at higher prices than that from sting bees in all districts except South district which sold its honey from sting bees at a higher price than the honey harvested from stingless bees. Districts which had higher prices per litre from stingless bees include; Mkoani (at Tshs. 7,500 per litre), Micheweni (at Tshs. 5,400 per litre) and Central (at Tshs. 5,000 per litre) (Table 3.24).

District	Stingless Bees (Price per Litre)	Sting Bees (Price per Litre)	Average Price Per Litre
North-B	0	3,000	3,000
Central	5,000	1,000	3,500
South	2,033	5,635	6,651
West	0	8,000	8,000
Wete	0	4,429	4,429
Micheweni	5,400	4,912	7,612
Chakechake	0	9,999	9,999
Mkoani	7,500	3,760	7,510
Total	14,560	25,687	25,955

Table 3.25: Number of Agricultural Households by Location and Honey Outlets

Outlet	Number of Households	%
Neighbours	894	66
Local markets	121	9
Secondary markets	63	5
Processing industries	0	0
Large scale farms	0	0
Trade at farms	109	8
Did not sell	161	12

3.5.3 Honey Outlets by Location and Region

In terms of outlets, neighbours were the major outlet for the produced honey as reported by 894 (66%) of the total households that produced/collect honey. The local markets were second largest outlet reported by 121 (9%) followed by trade at farms 109 (8%) and secondary markets 63 (4.7 per cent of the total households that produced/collect honey). A total of 161(12%) households that produced/collect honey were reported not to have sold honey to any outlet (Table 3.25).

District-wise, Micheweni had more households 321 or 27 percent of the total households which sold honey this was followed by Mkoani with 295 (25%), South district account 260 (22%). Wete

and Central districts had moderate number of households that sold honey with 102(9%) and 91(9%) respectively. The lowest number of household that reported to sell honey was in North 'B' and West districts of which accounted 2 and 3 percents (Chart 3.39).

3.6 Access to Extension Services by District

In Zanzibar, all the districts were observed to have received livestock

extension messages. The survey shows that, a total of 23,336 households received extension services presenting 26 percent of all the livestock keepers in Zanzibar (91,380 households). West district had the highest number of households (5,212 or 22.3 percent) receiving extension services, followed by Central district 3,921(16.8%), North 'B' 3,258 (14%), Mkoani 2,374 (10.2%), Wete 2,306 (9.9%), North A 2,268 (9.7%), South district 1,072 (4.6%), Chakechake 1,318 (5.6%) and Micheweni 1,606 (6.9%) (Chart 3.40).

3.6.1 Sources of Extension Services

The main source of livestock extension services was the Government accounting for 59 percent of the households which received advices. Other sources of advice came from neighbours (22%), Non Governmental Organizations (NGOs) and Development Projects (16%), Large Scale Farmers (14%), Radios/TVs/Newspapers (19%) and Cooperatives (5%) (Chart 3.41).

3.6.2 Extension Advice by Type of Messages

Extension Advice by Type of Messages provided included: proper feeding, advice on housing, proper milking and milk hygiene, disease control, pasture establishment, group formation, calf rearing, use of improved bulls, and livestock feeds processing.

Of these messages, disease control was provided to 21 percent of the households. Extension messages on feeds and proper feeding were provided to 9,615 (12%) and housing messages were provided to 9,222 (12%) households. Fewer households were provided with advice messages on use of improved bulls (6%), livestock feed processing (7%), proper milk hygiene (8%) and group formation (9%) (Table 3.26).

3.6.3 Number of Households which Received Advice Messages on Disease Control

As observed earlier, livestock diseases and the high rate of livestock infections were serious problems encountering livestock raising households. Advice on disease control was therefore very critical.

Table 3.26 Percentage of Households which Received Extension Advice by Type of Message

Advice	Number of Households	Percentage
Feeds and Proper Feeding	9,615	12
Advice on Housing	9,222	12
Proper Milking and Milk Hygiene	5,984	8
Livestock Fattening	4,535	6
Disease Control	16,150	21
Herd/Flock Size	4,479	6
Pasture Establishment	2,823	4
Group Formation	7,108	9
Calf Rearing	7,441	10
Improved Bulls	4,714	6
Livestock Feeds Processing	5,451	7

Most of the households received advice on disease controls. The situation was as follows: West 3391(21%), Central 3070 (19%), North 'B' 2,111(12%), Wete 1,794(11%), Mkoani 1,669(10%), Micheweni 1,022(6%). The district with smallest number of households that received advice on disease control were South and Chakechake with 5 percents each (Chart 3.42).

CONCLUSIONS

The livestock sector analysis focused mainly on livestock numbers by specie, district livestock distribution, productivity, livestock diseases, access to services and contribution to crop production. Data for the 2007/08 Agricultural Sample Census is compared with the previous census data so as to identify any structural changes within the districts between the census periods.

The main livestock species kept by smallholder farmers include cattle, goats, sheep, pigs and chicken. In the 2007/08 Agricultural Sample Census, there were about 132,959 households which kept livestock of which, 39,420 (29.6%) households kept cattle, 80,069 (60.2%) households kept chicken, 13,107 (9.9%) households kept goats. Pigs and sheep keeping households were 363 (0.3%) in total. In the surveyed households, chicken were the most dominant specie with 1,078,962 (82.5%) flocks followed by cattle (155,624 (11.9%) herds, goats 68,972 (5.3%) herds, donkeys and pigs. The proportion of households which kept donkeys, sheep and pig population were in total less than one percent. The total number of cattle raised by the smallholders was 155,624 heads out of which, the indigenous type represented 95.5 percent of the total cattle population. On average, the herd size per cattle holding in the smallholder sector was 4 heads. Central district followed by Micheweni, West and Wete were the leading districts in terms of cattle populations. In the five year period between 2003 and 2008, the total cattle population among the smallholders decreased by 4.5 percent from 162,643 to 155, 624 heads giving an annual negative growth rate of about 0.9 percent per annum over the five year period. Central district had the highest concentration of dairy cattle (29.7%) of the total dairy cattle population compared to other districts.

The average number of goats per household was 5 goats, the number has decreased by 9 percent compared to 2002/03 Agricultural Sample Census. Most of the households (97%) raised between 1 and 14 goats representing 74 percent of the total goat population. Among the districts, Central, West, North 'A' and Mkoani had the highest number of goats. The number of goats has increased by 30 percent between 2003 and 2008 with an annual growth rate of about 6 percent.

Unlike the goat population increase between 1993 and 2003, sheep population declined by 53 percent in the same period. However, the trend was reversed between 2003 and 2008, whereby the number of sheep increased from 300 to 574 representing an increase of 91 percent. For pigs, the trend was positive although the increase was small.

About 75 percent of the entire chicken population was kept by 96 percent of the households whereby the flock size was in the range between 1 and 49. The chickens were mainly of indigenous/ local type. The leading districts in terms of number of chicken were West (21.3%), Wete (13.8%), Mkoani (12.4%), North 'B' (11.2%) Chakechake (9.9%) and South (4.8%). These districts accounted for 73.4 percent of the total chicken population.

Most of the milk (99%) was from cows and production during the wet season was 111,616 litres per day which dropped to 84,383 litres per day during the dry season. Average milk production per cow was 2.5 litres during the wet season and 2.3 litres during the dry season. The number of milked cows has also dropped from 44,718 during the wet season to 36,639 in the dry season. The main milk producing districts were West (23%), Central (19%), Wete (13%) and North 'B' (14%). The four districts produced 69 percent of the total milk production in Wet season.

Contribution of livestock to crop production was very small as measured by the proportion of planted area using organic fertilizers. Only 7% of all households planting during Long rain used organic fertilizers and the area planted with organic fertilizers was only 7.8 percent. There were differences in the extent to which manure were used among districts. Furthermore the proportion of land applied did not correlate with the number of livestock owned, probably because most of the livestock are indigenous, and grazed on communal land,

Common diseases which affected the ruminants include Tick Borne Disease (TBD), Foot and Mouth Disease (FMD) and Lumpy Skin Disease. Almost 76 percent of the cattle raising households encountered Tick Borne Disease. The problem was more serious in Central district followed by Chakechake, Micheweni and Mkoani. Spraying with acaricides was the most common method used to control the infections. Dipping and smearing was however, less practiced. For chicken, Newcastle Disease and Fowl Typhoid were reported to remain as a challenge.

Access to livestock extension services was critical taking into consideration the widespread nature of the livestock diseases and the high rates of livestock infection. All the districts were observed to have received livestock extension messages. The main source of livestock extension services was the Government with about 59 percent of the households which received advice. Livestock diseases and the high rates of livestock infections were the serious problems encountered by the livestock raising households.

Access to extension services varied within the districts. West district had the highest number (22.3%) of the households which received regular extensions services followed by Central (16.7%) and North 'B'(14%). Chakechake and South districts had the least access to extension services of which jointly account only 10 percent. The government provided most of the needed extension services. Advice on disease controls was therefore very critical.

District Profiles

The following District Profiles summerize the status of Livestock Production in each district.

Central

Central district kept most of the cattle, particularly the improved dairy type. It also had more households with goats and higher number of goat population than any other district. The district also kept most of the pigs (63%) of the total pig population followed by West. However, the district had higher incidences of TBD, Lumpy sSkin disease, FMD and Worm infestations. Central district by its location had more access to extension services particularly from the government.

Micheweni

This district was second best in the number of livestock and ranked highest in the number of indigenous cattle. The proportion of dairy cattle was less than 2percent. It ranked third in terms of number of sheep. FMD was less than 2 percent. Incidences of TBD were high and the district was third in TBD cases after Central and Chake Chake. In terms of extension services, the district had relatively the lowest number of households which received extension services than any other district. Similary, the district had also received fewer advices on livestock disease control than Central and West.

Wete

Wete disrict ranked third in the number of livestock, number of cattle, improved dairy cattle and was also third in terms of number of households which kept improved dairy types. The district was second best in the number of chicken, especially the indigenous type. Incidence of TBD was 33 percent of the total livestock rearing households within the district. Access to extension services was moderate and was comparable to Micheweni and Chakechake(less than20%) and advices on disease was also modest (13.4%) compared to Central district in which 15.3 percent of the households reported to have received such advices from the government.

West

West district ranked first in the number of sheep followed by Central and Micheweni. However, the district was second best in the number of improved dairy cattle, number of households keeping dairy cattle and number of goats. It produced more milk than other districts followed by Central, Wete and North 'B' districts. It also ranked first in the number of chicken (21.3%) of the total chicken population and was second in number of pigs (37%). The access to extension services was generally good and the district had the highest number of households 5,212 (22.3%) with access to extension services.

North –'A'

North –A district kept the least number of livestock compared to other districts. It was second with smallest number of cattle, both indigenous and improved types. About 11 percent of the households kept 12 percent of the goats.. The district also had the lowest number of sheep (6%) and kept about 10 percent of the total chicken population.

With regard to disease incidences, the district North 'A' encountered less livestock diseases of all types in most of the livestock rearing households. Newcastle was moderate with about 30 percent of the agricultural households. A large number of households did not control Tick Borne disease and only 6 percent of the households did vaccination against the Newcastle disease. There was absolutely no Honey production and the district received little extension advices.

North-'B'

North –'B' district had few livestock just like North 'A'. It was the third with lowest number of cattle in Zanzibar and only 4.2 percent of the households kept 3.7 percent of the improved dairy cattle. The number of goat and sheep number was moderately low and also, the district raised 9.5 percent of the chicken population.

Disease incidences were low compared to other districts. Only 13 percent of the households reported incidences of Lumpy Skin disease, Tick Borne (3%), FMD (8%). Relatively, there were high incidences of Newcastle disease (slightly greater than 60%) and about 22 percent of the households did not control the disease. The district was third highest with proportion of households which dewormed their livestock and was first in terms of sheep and goat deworming. However, extension services were very poor.

South

Livestock keeping was not important in South district compared to other districts. The district had the least number of cattle, sheep and, goats. There is no household recorded to kept pigs. Very few (0.7%) dairy cattle were raised and the district was the second with lowest number of households which raised goats. As a result, disease incidences and extension services on the livestock were lowest. However, the district ranked highest in terms of honey production and honey sales.

Chakechake

The district had a moderate number of cattle sheep and goats. About 94 percent of the cattle population were of indigenous type. Households owned few goats, sheep and chicken. Tick Borne problem was reported by about 50 percent of the households, while incidences of other diseases were lower. The district was the third highest in the number of households which dewormed their cattle and second highest in the number of households which dewormed their sheep..

Honey production was moderate though the district had the highest number of stingless beehives. However, the average price of honey was highest in the district and livestock extension services were the second highest, but with moderate low advices on the livestock diseases.

Mkoani

The district had a moderate number of cattle (16,976 heads). Most (99%) of the cattle were of indigenous type . Goat population was fourth highest, though the district ranked second in terms of number of households rearing goats. The district was the third largest with number of households which kept indigenous chicken. The district had the moderate incidences of Tick Borne infection. In terms of Helminth control, it had the highest number of households which dewormed their cattle but was the least in sheep and goat deworming. Extension services were moderate and the district had few households engaged in honey production.

General Definitions

Who is a Smallholder /Small Scale farmer?

Should have one or more of the following: in the 2007/08 farming season had one or more cultivated and planted farms. The farm land may either be owned, rented, borrowed. The farmer may also be raising 1 and 50 head of cattle, and/or between 5 and 100 head of sheep/Goats/Pigs, and/or between 50 and 1000

Household: A group of people who occupy the whole of part one or more housing units and makes joint provision for food and/or other household items. Usually such a group comprises a husband, wife, and their children. Other relatives may be members of the household if they happen to live and get food provisions from the same household. People who live together and eat from the same pot may be considered as members of the same household even if they stay in separate dwellings. An individual who lives and eat alone is considered as an independent household.

Household Head: A person who is acknowledged by all other members of the household either by virtue of his age or standing in the household as the head. He/she should be a permanent resident of the house and he/she is the main person responsible for decision making regarding use of household resources..

Agricultural Holding: This is an economic unit of agricultural production under single management. This unit may have been grown various crops. For the purpose of the survey, the agricultural holdings are restricted to those which meet one of the following conditions:

- Having or operated at least 25 sq meter of arable land
- Own or keep at least one head of cattle or five goats/sheep/five pigs or fifty chicken/ducks/turkeys during the agricultural year 2007/08 (from October 2007 to September 2008).

Question Specific Definitions:

Type of Agriculture holding Codes (Q2.1):

Crops only: A holding is referred to be a crop only holding if it has cultivated at least one piece of land. This also applies to all households owning or have kept livestock whose number does not qualify such households to be an agricultural holding (No cattle, less than 5 goats/sheep/pigs, less than 50 chickens/turkeys/rabbits).

Livestock only: A holding is referred to be a livestock only holding if it has exercised livestock husbandry only during the 2007/08 agricultural year.

NOTE

For agricultural holding only and pastoralist holding only; the number of livestock should be at least one head of cattle, not less than five goats/sheep/pigs, not less than 50 chickens /turkeys /rabbits. This also applies to households having or operated less than 25 sq meter of cultivated land (which does not qualify the household to be considered as agricultural holding) but has the number of livestock that makes the holding qualifies to be considered as livestock holding.

Pastoralist holding: This refers to a household which practices livestock production as its major income generating activity and a means of subsistence, but moves from one place to another searching for water and pasture for the livestock. This movement usually involves long distances and in many cases the whole household unit moves with the livestock and they have no permanent place of residence.

Both crops and livestock: A holding is referred to be a both crops and livestock if it has cultivated a piece of land equal or exceeding 25 sq meter and if such households have own or kept livestock whose number qualify such household be considered as an agricultural holding.

Procedures for questions:

Q 2.1 Type of agriculture household/holding

Using the options under the question classify the type of agriculture household/holding

Note: If the household had an acre of crops and raised 40 chickens during 2007/08, it is classified as 'Crops only' as the number of chickens does not qualify the household as a livestock holding.

Off-farm income (Col 13) These are income made from activities NOT on the HH's farming activities. This can be from formal employment (e.g. in government etc.), temporary jobs, casual labourers and income generation activity and includes working for cash on other people's farms. Indicate whether each member was involved in an off farm income generating activity during 2007/08																											

Definition and working page for page 2

Question Specific Definitions:

Relation to head (Col2):

Household Head: A person who is acknowledged by all other members of the household either by virtue of their age or standing as the household head.

Read and Write (Col8)

Any other language: Must be a written language.

For someone who can read and write in Kiswahili and any other language apart from English, the correct code is 1. For one who can read and write in English and any other language apart from Kiswahili the the correct code is 2. Code 4 should only be used for any other language which is not English or Kiswahili.

Education Level Reached (Col10):

Ask the respondent the highest educational level reached. This aims at establishing whether at the time of enumeration the member of the household is studying has completed or has never studied. Make further enquiry for the level of education reached for those who have completed studies. Establish if the member had attained any training after graduation for the purposes for completing column number 9. For those who still continue attending studies during the period of this survey, establish their learning stage. For instance for a household member who studied up to Standard Three but did not complete his/her education at this level, then his/her highest education level reached is Standard Two. For those indicated under code 3 (not studied) in column 8 should be marked code 99 (Not applicable) in column 9.

Section 3.0 Note

Make sure that you define the hh proper to ensure that all the members of the hh are included. Ensure that you stress that the hh is not just the hh heads direct family and that it includes other people living and eating together with the family.

If you notice that the hh is large or you see many people around the hh and you have been given a smaller number of the hh members, make further enquiries until you are sure that you have captured all the hh members.

Section 3.0 Household information.

ii) For each household member complete columns 1, 2, 3 and 3

After completing columns 1, 2, 3 and 3 for each household member, go back to the first household member and complete the remaining columns for that member.

iii) Repeat step 2 for the rest of the household members.

4.0 LAND ACCESS/OWNERSHIP/TENURE				Identification			
4.1 LAND ACCESS/OWNERSHIP/TENURE							
Give details on Area owned by the household during 2007/08 agricultural season.							
Give area as reported by the respondent		Area in Acre					
				4.1.1 Was the whole household area used during the 2007/08 agricultural season? (Yes-1, No-2)			
4.1.1	Area under certificate of ownership						
4.1.2	Area owned under customary law						
4.1.3	Area bought			4.1.3 Do you consider to have enough land for your household? (Yes-1, No-2)			
4.1.4	Area rented from others						
4.1.5	Area borrowed from others						
4.1.6	Area share cropped from others			4.1.4 Is there any female who owns land or has customary rights to land ownership in this household? (Yes-1, No-2)			
4.1.7	Area under other forms of tenure						
Total area							
4.2 LAND USE							
Area used by the household for various agricultural activities during 2007/08 agricultural season							
Enter area as reported by the respondent in acres		Area in acre		Enter name for each			
4.2.1	Area planted temporary monocrops						
4.2.2	Area planted temporary mixed crops (e.g. maize and beans)						
4.2.3	Area planted permanent monocrops						
4.2.4	Area planted permanent mixed crops (e.g. banana, coffee, trees)						
4.2.5	Area planted permanent and temporary mixed crops (e.g. maize and banana)						
4.2.6	Area under pasture						
4.2.7	Area under fallow						
4.2.8	Area under natural forest						
4.2.9	Area planted trees						
4.2.10	Area rented to others						
4.2.11	Area unsuitable for agriculture						
4.2.12	Uncultivated arable land (minor area under fallow)						
Total area							

Definitions and working page for page 3

Definitions for Key Specific Questions

Section 4.1 – Land Access/Ownership

These are areas that were used by the households for the 2007/08 farming season

Lease/Certificate of Ownership: Area under lease/certificate of ownership refers to the areas which were issued by the government. The household possesses government issued leasehold title or certificate of ownership. The land will normally be officially surveyed and boundaries marked. This includes leased land bought from others where the lease/certificate of ownership has been transferred.

Customary Law: This refers to the land which the household does not have an official government but its right of use is granted by the traditional leaders.

Bought: This refers to the areas of customary land that has been bought from others. This land does not have an official title and therefore is not leasehold.

Rented from others: Land rented from others for cash or for a fixed amount in crop produce (e.g. fixed number of bags at harvest).

Borrowed: use granted by land owner free of charge. Land owner can either be a lease holder or has right of access through customary law.

Share cropping: where the household is permitted to use land which is then paid for from a percentage of the harvested crop

Section 4.2 Land Use

Temporary crops: are sown and harvested during the same agricultural year

Permanent crops: are crops once sown or planted last for some years and need not to be replanted after each annual harvest.

Permanent crops /mixed crops: This is a mixture of permanent and seasonal crops. The two crops can either be randomly planted together or in a particular pattern e; for example intercropping (1 row of maize and 1 row of beans). A field that has been divided into plots for different crops is not mixed).

This is further subdivided into:

Mixture of Permanent crops – two or more permanent crops grown together

Mixture of Permanent and Temporary crops – permanent crop and annual crop together

Mixture of Temporary crops – two or more temporary, annual crops grown together

Pasture land: this is an area of owned/allocated land which is set aside for livestock grazing. It can be improved pasture where the farmer has planted grass, applied fertilizer or where other means have been applied to improve the pasture. Or it can be natural pasture.

Natural Bush: Land which has naturally grown shrubs and trees and is considered productive but is not utilized for farming or livestock production.

Fallow: This is the area of land that is normally used for crop production, but is not used for crop production for a year or a number of years to allow for self generation of fertility/soil structure.

Planted trees: Land which is used for planting trees for poles or timber

Unusable: Land that is known to be unsuitable for agricultural production.

Uncultivated Usable: This is land that was not used for reasons other than fallow. The reasons could be lack of inputs/money/rainfall/etc

Overview to section 4

Overview to section 4

Section 4.0: Preliminary note

Land Access/Ownership

Land access/ownership refers to the area utilized by the members of the household. This does not include communal land where the resources are shared between household members. It does not include official communal land that the household has sole access to for example a plot for crop farming in the communal area.

Procedures for questions

Section 4.0 – Land Ownership

1. Ask the respondent if he knows the total areas of land the household has sole access to. If he knows make a note in the calculation space
2. Ask the respondent the area of the different land ownership categories the household has sole access to (Q4.1, 1 to 4.1.7) and record in the appropriate spaces.
3. Add up the area of the different categories of land and compare it with the total area obtained in step 1 (if the respondent provided the information)
4. If the total area is different find out which one is correct and make amendments where appropriate.

Section 4.2: Land Use

1. Ask the respondent the area of the different land use categories the household has sole access to (Q4.2.1 to 4.2.12) and record in the appropriate spaces.
2. Add up the area of the different categories of land and compare it with the total area obtained in section 4.0. The total area should be the same.
3. If the total area is different find out which one is correct and make amendments where appropriate.

Planted Area: Area in acre the household was able to plant
Harvested Area: Area in acre the household was able to harvest a large portion of harvest. this is the same as the area planted minus the area that was destroyed by floods/pets/animals.

Temporary/Annual Crops: Crops planted and harvested within 12 months after which time the plants die. Most annual crops are planted and harvested on a seasonal basis.

Cash crop codes:

Code	Crop
01	Cotton
02	Tobacco
03	Payathum
04	Jute
05	Sisal

Crop Codes (Cash/Tubers/Roots):

Code	Crop
11	Maise
12	Paddy
13	Sorghum
14	Sunah Malt
15	Finger Malt
16	Wheat
17	Barley
18	Green Potatoes
19	Yam
20	Cassava
21	Onion
22	Ginger

Vegetable Codes:

Code	Crop
30	Cabbage
31	Tomatoes
32	Spinach
33	Carrot
34	Chilies
35	Amaranth
36	Pumpkin
37	Cucumber
38	Egg plant
39	Water melon
40	Cauliflower
41	Melon
42	Onion
43	Radish
44	Green Beans
45	Bean

Crop Codes Legumes and Oil:

Code	Crop
51	Beans
52	Compass
53	Green Gram
54	Chick Peas
55	Groundnut
56	Samburu nut
57	Ngene
58	Sunflower
59	Sesam
60	Groundnut
61	Soya beans
62	Caster Seed

Instructions for calculating the area of mixed crops in a medium:

- If the mixed crop is mixed annual only enter the total area of the field in the remaining area under temporary Crop and go to step one of these instructions.
- If the mixed crop is mixed permanent and annual try to work the percent area taken by the different crops and calculate the area of annual crops outlined in step 1. Otherwise use the number of trees method to calculate the area of annual crops in the mtc.
- Number of trees method to calculate annual crop areas in a permanent-annual crop mtc:
 - List each of the permanent crop in column land enter the ground area per acre for each permanent crop (from instructions for page 5) in column d.
 - Enter the number of permanent trees in the mtc in column e as will be provided to you by the respondent.
 - Calculate the area occupied by each crop by multiplying column d and column e and sum up these to obtain the total area of permanent crops in the mtc.
 - To obtain the area for temporary crops subtract (-) the area for permanent crops from the total area of crop mtc and enter the result in the total area under temporary crops.
 - Proceed to step 1 to calculate the area under each temporary crop.
- Enter the name of each temporary crop in the crop mtc and estimate percentages of each crop.
- Using the percentage for each crop, calculate the area for each crop from the remaining area under temporary crop.
- After completing the codes for all the fields, sum the area of each crop in the mtc plus any monocrops and enter the totals in section 5.1.1 Column 2.
- Once the quantity harvested is obtained, calculate the yield (metric tonnes/ha) and compare the figures with the norms given in the crop code box. If there is significantly difference, check the area and the amount harvested.

Definitions and working page for page 5

Storage (Col. 30, Q 5.1.1):

- **Traditionally Made structures:** The design of storage structures villagers have inherited from forefathers.
- **Improved Traditionally made structures:** The design of traditional storages structures improved through modern technology.

Marketing Challenges Q 5.1.1 Col. 33:

- **Farmers' Association:** Village farmers who came together and started an association for the purposes of purchasing inputs/selling/storage of crops aiming at fetching better prices.
- **Cooperative Union:** A large inter-village/community set up in the district/region or at national level for providing inputs, markets and storage of farmers' crops.
- **Government Regulatory laws for crops marketing:** Government instituted laws for regulating transportation and selling of crops.

Inputs (Q 5.1.1)

Farm Yard Manure: An organics fertiliser made on farm from animal dung.

Compost: An organic fertiliser made on farm from decomposed plant materials.

Insecticides: This is the chemical used in protecting plants or killing pests.

Fungicides: Protects plants from fungi attack.

Herbicide: Chemicals used to control or kills weeds.

Improved seeds: Scientifically attested to be suitable for agricultural use.

Questions specific definitions

Q 5.1.1. Instructions on crops storage:

1. For the listed crops establish whether or not the household stored crops for 2007/2008 agricultural season.
2. For the listed crops give explanations on storage.

Crops storage is keeping/reserving crops in a container or a special place for future use.

Q 5.1.1 Col 31

1. For each of crops listed indicate major marketing problems for 2007/2008 agricultural season.

Instructions for calculating the area of mixed crops in a mixture:
 A. If the mixed crop is mixed annually only enter the total area of the field. In the remaining area under temporary crop and go to step one of these instructions.
 B. If the mixed crop is mixed permanent and annual, try to work the percentage taken by the different crops and calculate the area of annual crops outlined in step 1. Otherwise use the number of seeds method to calculate the area of annual crops in the mix.
 C. Number of seeds method to calculate annual crop areas in a permanent-annual crop mix:
 (i) List each of the permanent crop in column b and enter the ground area per acre for each permanent crop (from instructions for page 6) in column d.
 (ii) Enter the number of permanent seeds in the mix in column e as will be provided to you by the respondent.
 (iii) Calculate the area occupied by each crop by multiplying column d and column e and sum up these to obtain the total area of permanent crops in the mix.
 (iv) To obtain the area for temporary crops, subtract (-) the area for permanent crops from the total area of crop mix and enter the result in the total area under temporary crops.
 (v) Proceed to step 1 to calculate the area under each temporary crop.
 1. Enter the name of each temporary crop in the crop mix and estimate percentages of each crop.
 2. Using the percentage for each crop, calculate the area for each crop from the remaining area under temporary crop.
 3. After completing the exercise for all the fields, sum the area of each crop in the mix plus any monocrops and enter the totals in section 2.1.1 Column 2.
 4. Once the quantity harvested is obtained, calculate the yields (metric tonnes/hectare) and compare the figures with the norms given in the crops code box. If there is a significant difference, check the area and the amount harvested.

- **Government Regulatory laws for crops marketing:** Government instituted laws for regulating transportation and selling of crops.

Inputs (Q 5.2.1)

Farm Yard Manure: An organics fertiliser made on farm from animal dung.

Compost: An organic fertiliser made on farm from decomposed plant materials.

Insecticides: This is the chemical used in protecting plants or killing pests.

Fungicides: Protects plants from fungi attack.

Herbicide: Chemicals used to control or kills weeds.

Improved seeds: Scientifically attested to be suitable for agricultural use.

Questions specific definitions

Q 5.2.1. Instructions on crops storage:

1. For the listed crops establish whether or not the household stored crops for 2007/2008 agricultural season.
2. For the listed crops give explanations on storage.

Crops storage is keeping/reserving crops in a container or a special place for future use.

Q 5.2.1 Col 33

1. For each of crops listed indicate major marketing problems for 2007/2008 agricultural season.

Working area/calculation space

Definitions and working page for page 8

Permanent Crops:

These are crops once planted last longer in the farm and need not be replanted after each annual harvest. Most of the permanent plants include trees such as coconut trees, apple trees, grape trees, banana trees, pineapple trees etc.

Number of Trees:

These include mature trees and premature trees.

Number of mature plants:

A total of fruit bearing trees (e.g. mango trees, orange trees, avocado trees e.t.c).

Instructions for permanent monocrops and crop mix:

A. For a field with permanent monocrop enter farm size in column 3.

B. For a field with a permanent crop mix or a temporary crop mix, enter the number of trees only in column 4.

C. For a field with a permanent crop mix/temporary annual crops, either:

- Enter the area in column 4, if the total area for permanent crops was obtained through calculation of percentages of each crop

OR

Enter the number of tree in column 5, if the number of plants/ seedlings of permanent crops was excluded.

21 Cassava: Cassava is a temporary crop, in order to simplify data collection on areas of production, data on cassava will be collected from areas under permanent crops.

Permanent crops:(crop oils)

Code	Crop	Area per crop
44	Palm Trees	0.00049
45	Coconut tree	0.00037
46	Cashew nut tree	0.00062

Permanent crops (Cash crops)

Code	Crop	Area per crop
53	Sisal	0.00012
54	Coffee	0.00049

Storage (Col. 33, Q 5.3.1):

- **Traditionally Made structures:** The design of storage structures villagers have inherited from forefathers.
- **Improved Traditionally made structures:** The design of traditional storages structures improved through modern technology.

Marketing Challenges Q 5.3.1 Col. 35:

- **Farmers' Association:** Village farmers who came together and started an association for the purposes of purchasing inputs/selling/storage of crops aiming at fetching better prices.
- **Cooperative Union:** A large inter-village/community set up in the district/region or at national level for providing inputs, markets and storage of farmers' crops.
- **Government Regulatory laws for crops marketing:** Government instituted laws for regulating transportation and selling of crops.

Inputs (Q 5.3.1)

Farm Yard Manure: An organics fertiliser made on farm from animal dung.

Compost: An organic fertiliser made on farm from decomposed plant materials.

Insecticides: This is the chemical used in protecting plants or killing pests.

Fungicides: Protects plants from fungi attack.

Herbicide: Chemicals used to control or kills weeds.

Improved seeds: Scientifically attested to be suitable for agricultural use.

Questions specific definitions

Q 5.3.1. Instructions on crops storage:

1. For the listed crops establish whether or not the household stored crops for 2007/2008 agricultural season.
2. For the listed crops give explanations on storage.

Q 5.3.1 Col 35

1. For each of crops listed indicate major marketing problems for 2007/2008 agricultural season.

Working area/calculation space

Definitions and working page for page 10

Investment in agriculture

Investment activities:

Investment activities refer to medium to long term farm development structures and projects. This can be irrigation structures, erosion control and water harvesting structures or other permanent or semi-permanent investment made on the land that the household owns.

Irrigated farming: Section 6.5:

Source of irrigation water (Col 1): The main source of the water used for irrigation.

Method of obtaining water (Col 2): The mechanism by which the water is extracted from the source

Irrigatable area (Col 3): The area the irrigation system is designed to cover in acreage

Area of irrigated land during the 2007/08 (Col 5): Area of land under irrigation during the 2007/08 agricultural year. This is the actual area and NOT the cumulative areas recultivated in 2 or more cropping seasons.

Q 6.5 Irrigation.

1. If a household uses irrigated farming give explanations on source and method of obtaining water.

2. See Col 10, Q. 5.1.1 and 5.2.1 and Col 12, Q 5.3.1 to see if irrigation was applied to any crop.

Farm implements, Q 6.1:

1. Column 2 Indicate whether or not inputs were used

2. Complete column 3 by entering the number of inputs used.

Farm Implements (Col. 1):

Machette: Include all implements use in tree cutting namely cicle, et.c.

Sprinkler: The pump carried on the back or a hand used water pump

Handused small tractor: A small tractor used in cultivation while the user walks on foot (see photo).

Section 6.2 Use of draft animals

Animals used in agricultural activities by the household during 2007/08 agricultural season.

Castrated Bulls: Castrated oxen meant for use in agricultural production.

Uncastrated Bulls: mature bulls used for garicultural activities but are not castrated.

Cow: Farmers also use mature female cattle in agricultural activities due to shortage of bulls

Donkey: Mature Male or female donkeys are also used for agricultural production.

Farm inputs: Sections 6.3 and 6.4

1. Column 2 Indicate whether or not inputs were used.

2. Complete column 3 by indicating where the inputs were obtained and column 4 by indicating the distance from where the inputs were obtained

Compost: An organic fertiliser made on farm from decomposed plant materials.

Insecticides: This is the chemical used in protecting plants or killing pests.

Fungicides: Protects plants from fungi attack.

Herbicide: Chemicals used to control or kills weeds.

Improved seeds: Scientifically attested to be suitable for agricultural use.

6. SOIL EROSION		Identification		<input type="text"/>																				
6.1 Did the household experience soil erosion during 2007/08 agricultural year? <input type="checkbox"/>																								
6.2 Did the household apply any methods for erosion control/water harvesting during 2007/08 agricultural year? <input type="checkbox"/>																								
[Year-1, Ha-2] [If the answer is Ha, Proceed to Section 7.2]																								
Ha	Mechanisms of controlling erosion/ Water harvesting	Number of meters	Year of erosion loss		Type of erosion control/water harvesting	Number of meters	Year of erosion loss

Definitions and working page for page 11

Q 6.6

The type of erosion control/Water harvesting (Col 1)

Terraces: Structures constructed on mountain slopes to provide flat terrain for crop planting.

Erosion control bunds: these are bunks of earth/stones built perpendicular to the slope to slow down the speed of water and thus preventing soil erosion. Its differs from terraces in that the soils on these banks are not at ground level .

Gabions: A box like structure made of wire and filled with large stones to prevent gully erosion.

Sand bags: Are used in controlling and preventing gully erosion
Tree belt/wind breaks: Trees planted against the wind direction for breaking wind speed..

Section 7.0 Acces to credit for crop or livestock production

Credit refers to something provided in cash or in kind (such as farm inputs, machines, livestock and other things) for crop or livestock production. The value of the credit must be repaid back to the lender. An Interest may or may not be attached to the value of the credit

The credit may be repaid either in cash or through farm produce to be harvested .

In this question the enumerator is at liberty to inquire up to three sources of credit where the farmer accessed credit from more than one source.

Q 6.6 Number of water harvestin structures and year of construction

1. The number water haversting structures refers to the number of wokring / maintained structures and does not include derelict or iireparable structures.

2. Year of construction refers to the year in which the structures were built, and not the year the structures were last repaired.The year should be written in figures e.g. 1998, 2006.

Section 7.0 Source of agriculture credit

If tghe farmer obtained credit from more than one source the use the code from the list provided. Start with the main source of credit in Section "7.1.1". a

Section 8.0 Agricultural extension services

1. Ask if the household did receive agricultural extension services during 2007/08 agricultural season from the respondents listed in column 1, then enter column 2.

2. Complete all columns for every extension officer.

Section 8.0 Agricultural Extension Services

Agricultural Extension Services: Refers to educational services provided to farmers by exetsion officers for the purposes of increasing crop and livestock production.

Share-cropping: Refers to farming where smallholder / Smallscale farmer enters into an agreement with large scale farmer where the former sells produce to the latter in exchange of provisions of farm inputs and the like. .

Contract farming Farming: Farming agreement entered between smallscale and large scale farmerswith regards to markets of farm produce and provision of farm inputs

9.1 LIVESTOCK (LIVESTOCK AND FISH) Modification

9.1.1 CATTLE

Did your household keep or raise cattle during 2007/08 agriculture year? Yes-1, No-2 (If the answer is No proceed to Section 9.3) ☐

Number of cattle as of 1.10.2008

No.	Type of cattle	Number of indigenous cattle	Number of improved cattle		Total
			For meat	Dairy	
		(1)	(2)	(3)	(4)
9.1.1	Contracted bull	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
9.1.2	uncontracted bull	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Grand total					<input type="text"/>

Milk Production: GOAT

No.	Season	Number of milked goats	Group of prices (kg)	Group number of total milk produced	Average price per liter per season
		(1)	(2)	(3)	(4)
9.3.6	Rainy	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
9.3.7	Dry	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Definitions and working page for page 12

Q 9.1 and 9.3 : What is required is to establish whether or not the household kept or raised the listed livestock during 2007/08 agricultural season (i.e. from October 2007 to September 2008). Also to establish the number of livestock as of 1st October 2008

Keeping or raising livestock is to to keep livestock at home while providing the livestock with animal feeds and medication and other services. The livestock could be owned by the farmer or kept on behalf of relatives or neighbours .

Sections 9.1.1 to 9.1.7 Cattle

Note:

Q 9.1 is for the actual number of cattle owned or kept by the household (as of 1st October 2008). This number does not include herds of cattle kept on behalf by relatives or neighbours; that is, the cattle outside the residential area of the household under survey.

1. If the the household keep mature fecund female cattle, it is expected that such a household will have calves which will be entered in question 9.1.6 or 9.1.7

Type of cattle (section 9.1.1 to 9.1.7)

Bull: Mature uncastrated male cattle used for breeding

Cow: Mature female cattle that has given birth at least once

Ox: Castrated male cattle used for farm work

Steer: Castrated male cattle used for meat

Heifer: Female cattle of 1 year up to the first calving

Calves: Young cattle under 1 year of age

Section 9.3 Goat

Note:

Question 9.3 is for the actual number of owned or raised by the household (as of 1st October 2008) This number does not include goats kept on behalf by relatives or neighbours, that is the goat outside the residential area of the household under survey.

1. If the household has she goats, you would normally expect them to have kids

Type of Goat (Qs 9.3.1 to 9.3.5)

Billy Goat (he-goat): Mature Uncastrated male goat used for breeding

Castrated goat: Male goat that has been castrated

She Goat: Mature female goat over 9 months of age

Definitions and working page for page 13

Q 9.1 and 9.3 : What is required is to establish whether or not the household kept or raised the listed livestock during 2007/08 agricultural season (i.e. from October 2007 to September 2008). Also to establish the number of livestock as of 1st October 2008

Keeping or raising livestock is to to keep livestock at home while providing the livestock with animal feeds and medication and other services. The livestock could be owned by the farmer or kept on behalf of relatives or neighbours .

Sections 9.4 Sheep

Note:

Q 9.4 is for the actual number of sheep owned or kept by the household (as of 1st October 2008). This number does not include sheep kept on behalf by relatives or neighbours; that is, the sheep outside the residential area of the household under survey.

1. If the the household keep ewes, it is expected that such a household will have calves which will be entered in question 9.1.6 or 9.1.7

Type of Sheepe (Section 9.4.1 to 9.4.5)

Ram: Mature Uncastrated male sheept used for breeding

Castrated sheep: Male sheep that has been castrated

Ewe: Mature female sheep over 9 months of age

Lamb: Young sheep under 9 months of age.

Section 9.5 Pigs

Note:

Question 9.3 is for the actual number of pigs owned or raised by the household (as of 1st October 2008). This number does not include pigs kept on behalf by relatives or neighbours, that is the cattle outside the residential area of the household under survey. .

1. If the household has she goats, you would normally expect them to have kids in column

Type of Pigs (Qs 9.5.1 to 9.5.5)

Boar: Mature Uncastrated male pig used for breeding

Sow: Mature female pig that has given birth to at least one litter of pigs.

Gilt: Female pig of over 3 months up to the first farrowing

Tanzania Agriculture Sample Census - 2007/08

Definitions and working page for page 14**Control of livestock diseases causing bugs**

Livestock worm control medicine: Medicine used to kill or control livestock on livestock. It is often used for cattle, goats, sheep and pigs.

Tiick: Is a dangerous bug that sucks blood from livestock and transmits animal diseases from one to the other animal.

Tsetse fly: A fly like bug that sucks blood from livestock and transmits diseases spreading sickness from one to the other animal.

Livestock advice (Section 9.8)

IA service provided by extension officers to livestock keepers for increasing livestock

9.9 FISH FARMING														Identification 			
Did your household practice fish farming? Yes=1, No=2 (If the answer is no proceed to section 9.10)																	
Give details on the fish farming during 2007/08 agriculture year																	
No.	Number of Ponds	Area of Pond (m ²)	Square area of Pond (m ²)	Source of fingerlings	What is the frequency of stocking	Kind of fish stocked	Total number of stocked fish				Total number of fish harvested	Total weight of all fish		What is the main fish sold?			
							Tilapia	Mushtika	Catfish	Labe		uselinusue (kg)	uselinusue (kg)				
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)

Definitions and working page for page 15

General definitions

Fish farming: Refers to the rearing/production of fish. It is different from fishing in that in fish farming the fish have to be reared. While in fishing, fishing nets or traps are used to catch fish from rivers, lakes and the sea; thus fishing should not be included in this section

Working space for page 15

I

Question Specific Definitions (Q9.9)

Production unit number (Col1): A production unit is a pond river/lake which is treated as a separate entity for the production of fish eg it may be by virtue of manageable size, maturity of fish, type of fish etc. eg. a farmer may have 3 fish ponds (each one is a separate production unit).

Frequency of stocking (Col. 5): What is the number of time the farmer puts new fingerlings into the pond each year.

Fingerlings: These are young immature fish used for stocking ponds.

Sols: (Col 10 & 11)

If no fish were sold enter "0" in column 10 and 11`

Fish sold (Col.12)

Kama hakuna samaki waliouzwa jaza "0" katika safuwima 12

Definitions and working page for page 16**10.0 Household poverty indicators****Number of rooms used for sleeping in the household (Q 10.1.4)**

Include sitting room, dining room, kitchen, etc if used for sleeping.

It also includes rooms outside the main dwelling

A room is defined as a space which is separate from the rest of the building by a permanent wall or division. A building / house that is not divided into rooms is considered to have one room.

Household assets (Q 10.2):

These assets must be functional. Do not include if broken.

Access to drinking water (Q 10.4):

If there is more than one source use the one, which the hh uses most frequently.

Main source of hh cash income: (Q 10.7):

Activity that provides the hh with the most cash during 2007/08 agricultural season.

Average maximum yields per area					
Use this table to compare the yields calculated in Sections 5.1, 5.2 and 5.3.					
These stats are strictly to be used as a guide for the purpose of assisting to get the correct area a

7

Obtain answers to the following questions from the meeting of enumerator and key informants in the village. Key informants can be a village chairman, Village Local Government Executive Officer, Councillor, Ward Chairman, Village extension officer, or any knowledgeable member in the community. Where possible ask these questions to a group in order to reach a consensus. The number should be below five people.

Procedure: Administer this form after completing all smallholder questionnaires for the village.

1. Copy the name of all crops from Sections 5.1, 5.2 and 5.3 grown in the village from smallholder questionnaires

This should also include livestock raised by the household from questions 9.1, 9.2, 9.4 and 9.5 and enter them in column 1 of this form. Also see codes for livestock below.

2. Enter price estimates per kg in col 5 and 6.

Question Specific Definitions:

Obtain answers to the following questions from the meeting between the enumerator and influential farmers in the village. Influential people can be Village Chairman, Village Government Executive Officer, Councillor, Ward Chairman, Extension Officer in the village or any other person in the village and who is well informed about village matters. It is important to not that these questions must be asked in groups (of more than one people) to obtain answers discussed and approved by many people.

Definitions of some specific terms

Access to community resources. Section 1.0

Community Resources: Resources in which the hh members have no individual claim to and which are shared together by all the village

Community Land: The area officially demarcated by the village as shared/public land.

Squatting farmers Land: Communal land where individual hhs make sole claim to (for crop farming or fenced livestock) without official rights to ownership.

Available remaining Land: Official area of communal land minus areas of squatting farmers.

Government Land Reserve: Area set aside by the government as national reserve

Community tree planting scheme (Section 14.3)

Community Forest: A forest planted on the communal land which is planted, replanted or spt planted by the members of the village.

Plant Planting: An area designated by the village for planting a block of trees.

Spot Planted: Replanting an area where selective logging has been carried out. A tree is planted to replace the one that has been cut.

Indigenous Trees: Trees that are native to Tanzania

Exotic Trees: Trees that are not native to Tanzania

Non Government Organisation: Is managed by people from outside the village and it normally covers more than one village/District/Region. Its function is to provide development assistance to the farmer and is free from direct government links.

Village level organization: is managed by members of the village. Its purpose is normally to access/provide development assistance to the village

ACCESS TO COMMUNAL RESOURCES

1. How many villages have been surveyed? (Year 1, Mar-2)		[Yes=1 No=2]		<input type="checkbox"/>
2. Area of Community Village Wood as		Area to area		
2.1	Total area of community land	<input type="text"/>		
2.2	Area of existing forest in community	<input type="text"/>		
2.3	Existing available community land	<input type="text"/>		
2.4	Community forest land	<input type="text"/>		
3. STATEMENT ON STATUS OF RESOURCES IN PRESENT SITUATION				
Community Resource		25 Acres for the community in the village	25 Acres	25 Acres
		25 Acres	25 Acres	25 Acres
3.1	Water for home consumption	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.2	Water for livestock	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.3	Community grazing land	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.4	Community forestland	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.5	Wood for charcoal burning	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.6	Wood for building pole	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.7	Forest for bee keeping (honey)	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.8	Fishing	<input type="text"/>	<input type="text"/>	<input type="text"/>
3.9	Feeding	<input type="text"/>	<input type="text"/>	<input type="text"/>
4. COMMUNITY PLANTED TREES				
4.1 Did your village have community planted trees during 2002/03 period? (Year 1, Mar-2)				
[Yes=1 No=2]				
5. Details of the community tree planting scheme				
No.	Number of trees planted	Number of trees planted	Number of trees planted	Number of trees planted
5.1	2002/03	2002/03	2002/03	2002/03
5.2	2002/03	2002/03	2002/03	2002/03
6. Community Forest Management (CFM) Cell				
6.1 Did you have CFM Cell in the village during 2002/03 period? (Year 1, Mar-2) [If no, proceed to Section 4]				
[Yes=1 No=2]				
6.2 Type of CFM Cell				
6.3 Extension/Research				
6.4 Service/Agro-processor				
6.5 Community Development				
6.6 Other				
6.7 Did the village have Field Form schools during 2002/03 period? (Year 1, Mar-2)				
[Yes=1 No=2]				
6.8 Did the village have local in-schools during 2002/03 period? (Year 1, Mar-2) [If no, proceed to 6.9]				
[Yes=1 No=2]				
6.9 Number of local in-schools				
[Yes=1 No=2]				
7. Community Forest Management				
7.1 Did the village have CFM Cell during the 2002/03 period? (Year 1, Mar-2)				
[Yes=1 No=2]				
7.2 Type of CFM Cell				
7.3 Extension/Research				
7.4 Service/Agro-processor				
7.5 Community Development				
7.6 Other				
7.7 Did the village participate in any research or project/program/extension during the 2002/03 period? (Year 1, Mar-2)				
[Yes=1 No=2]				
7.8 Did the village have any training activities or development during 2002/03 period? (Year 1, Mar-2) [If no, proceed to 7.9]				
[Yes=1 No=2]				
7.9 Number of training activities or development				
[Yes=1 No=2]
