PREFACE

At the end of the 2002/03 Agriculture Year, the National Bureau of Statistics and the Office of the Chief Government Statistician in Zanzibar in collaboration with the Ministries of Agriculture and Food Security; Water and Livestock Development; Cooperatives and Marketing as well as the Presidents Office, Regional Administration and Local Government (PORALG) conducted the Agriculture Sample Census. This is the third Agriculture Census to be carried out in Tanzania, the first one was conducted in 1971/72, the second in 1993/94 and 1994/95 (during 1993/94 data on household characteristics and livestock count were collected and data on crop area and production in 1994/95).

It is considered that this census is one of the largest to be carried out in Africa and indeed in many other countries of the world. The census collected detailed data on crop production, crop marketing, crop storage, livestock production, fish farming, tree farming, access to infrastructures and services and poverty indicators.

In addition to this, the census was large in its coverage as it provides data that can be disaggregated at district level and thus allow comparisons with the 1998/99 District Integrated Agricultural Survey. The census covered smallholders in rural areas only and large scale farms. This report presents Dodoma region data disaggregated to district level. It was very difficult to discuss all variables collected in a single report hence the analysis was based on the most important smallholder variables. The rest of the variables are found in the e attached annex of table of results. The analysis in the report includes time series comparisons using data from the previous censuses and surveys.

The extensive nature of the census in relation to its scope and coverage is a result of the increasing demand for more detailed information to assist in the proper planning of this sector and in the administrative decentralization of planning to district level. It is hoped that this report will provide new insights for planners, policy makers, researchers and others involved in the agricultural sector in order to improve the prevailing conditions faced by crop producers and livestock keepers in the country.

On behalf of the Government of Tanzania, I wish to express my appreciation for the financial support provided by the development partners, in particular, the European Union as well as DFID, UNDP, Japanese Government, JICA and others who contributed through the pool fund mechanism.

Finally, my appreciation goes to all those who in one-way or the other contributed to the success of the survey. In particular, I would also like to mention the enormous effort made by the Planning Group composed of professionals from the Agriculture Statistics Department of the National Bureau of Statistics (NBS), the Office of the Chief Government Statistician in Zanzibar (OCGS) and the Statistics Unit of the Ministry of Agriculture and Food Security (MAFS) with technical assistance provided by Ultec Lawrence Gould (ULG), Scotts Agriculture Consultancy Ltd and the Food and Agriculture Organisation of the United Nations (FAO).

Additionally, I would like to extend my appreciation to all professional staff of the National Bureau of Statistics, the sector Ministries of Agriculture and PORALG, the Consultants as well as Regional and District Supervisors and field enumerators for their commendable work. Certainly without their dedication, the census would not have been such a success.

Radegunda Maro Ag. Director General National Bureau of Statistics

EXECUTIVE SUMMARY

The executive summary highlights the main census results obtained during the National Sample Census of Agriculture 2002/03. This report covers small-scale agriculture households which were selected using statistical sampling techniques in rural areas of Dodoma region. The results in the report do not cover urban areas and large-scale farmers.

The highlights describe the important findings in relation to agricultural production, productivity, husbandry, access to resources, levels of involvement in agricultural related activities and poverty in Dodoma region. It provides an overview of the rural agricultural households and their levels of involvement in agricultural related activities at region level.

i) Household Characteristics

The number of agricultural households in Dodoma region was 323,719 out of which 233,709 (72.2%) were involved in growing crops only, 608 (0.2%) were involved in livestock keeping only and 89,402 (27.6%) were involved in crop production as well as livestock keeping.

Most of the agriculture households rank annual crop farming as an activity that provides most of their cash income followed by off farm income, tree/forest resources, livestock keeping/herding, remittances, permanent crop farming and fishing/hunting.

Dodoma region had a total literacy rate of 60.6 percent. The highest literacy rate was found in Kondoa district (64.1%) followed by Dodoma Urban district (62.8%) and Mpwapwa district (62.7%) and Kongwa (60.7%). Dodoma Rural district had the lowest literacy rate of 55.4 percent. The literacy rate for the heads of households in the region was 62.1 percent 68% for male heads and 40.9% for female heads).

The number of heads of agricultural households with formal education in Dodoma region was 193,009 (59.6%), those without formal education were 122,648 (37.9%) and those with only adult education were 8,062 (2.5%). The majority of heads of agricultural households (57.1%) had primary level education whereas only 2.6 percent had post primary education.

In Dodoma region 47,080 households (15%) had only one member aged 5 and above involved in off-farm income generating activities, 177,373 households (55%) had two members involved in off-farm income generating activities and 95,192 households (30%) had more than two members involved in off-farm income generating activities.

ii) Land Use

The total area of land available to smallholders in Dodoma region was 855,264 ha. The Regional average land area utilised for agriculture per household was only 2.4 ha. This figure is above the national average which is estimated at 2.0 hectares.

iii) Annual Crop and Vegetable Production

The area planted with annual crops and vegetables was 658,978 hectares out of which 980 hectares (0.15%) were planted during dry season and 657,998 hectares (99.85%) during wet season. The area planted with cereals in Dodoma region was 502,753 ha (76.3% of the total planted area with annual and vegetable crops), followed by oils seeds with 120,211 ha (18.2%), pulses 20,554 ha (3.1%), root and tubers 13,419 ha (2.0%) and fruit and vegetables 2,041 ha (0.3%). No annual cash crops production was reported in the region.

Maize

Maize is the dominant annual crop grown in Dodoma region and it has a planted area 4.4 times greater than bulrush millet, which had the second largest planted area. The area planted with maize constitutes 52.5 percent of the total area planted with annual crops in the region. Other crops in order of their importance (based on area planted) are groundnuts, sorghum, sunflower, simsim and cassava.

There was a sharp increase in maize production over the period of 1995 to 1996 (106%), after which the production dropped by 58 percent over the period 1996 to 1997. There was a gradual increase in production over the period 1997 to 2000 followed by a decline in production over the period 2000 to 2003. The average area planted with maize per household was 1.3 hectares, however it ranged from 0.7 hectares in Dodoma Urban district to 2.9 hectares in Kongwa district. Kongwa district had the largest area of maize (131,930 ha), followed by Kondoa (79,653 ha), Dodoma Rural (62,118 ha), Mpwapwa (51,352 ha) and Dodoma Urban (20,887 ha).

Bulrush Millet

Bulrush millet is the second most important cereal crop in the region in terms of planted area. The number of households that grew bulrush millet in Dodoma region during the wet season was 105,464. This represents 33 percent of the total crop growing households in Dodoma region in the wet season. The total production of bulrush millet was 22,711 tonnes from a planted area of 78,496 hectares resulting in a yield of 0.29 t/ha.

Sorghum

Sorghum is the third most important cereal crop in the region in terms of planted area. The number of households that grew sorghum in Dodoma region during the wet season was 87,136. This represents 23 percent of the total crop growing households in Dodoma region in the wet season. The total production of sorghum was 22,032 tonnes from a planted area of 63,932 hectares resulting in a yield of 0.34 t/ha.

Roots and Tubers

The total production of roots and tubers was 5,544 tonnes. Cassava production was higher than any other root and tuber crop in the region with a total production of 3,896 tonnes representing 70.3 percent of the total root and tuber crops production. This was followed by Irish potatoes with 1,268 tonnes (22.9%) and sweet potatoes (380 tonnes, 6.8%).

Pulse Crops Production

The total area planted with pulses was 20,554 hectares, of which 9,620 ha were planted with beans (46.8 percent of the total area planted with pulses), followed by cow peas (5,737 ha, 27.9%), bambaranuts (4,956 ha, 24.1%), green gram (96 ha, 0.5%), chick peas (88 ha, 0.4%) and mung beans (57 ha, 0.3%).

Oil Seed Production

The total production of oilseed crops was 43,948 tonnes planted on an area of 120,211 hectares. Groundnuts were most important oilseed crop with 78,311 ha (65.1% of the total area planted with oil seeds), followed by sunflower (21,074 ha, 17.5%), simsim (20,709 ha, 17.2%) and soya beans (116 ha, 0.1%).

Fruit and Vegetables

The total production of fruit and vegetables was 3,419 tonnes. The most cultivated fruit and vegetable crop was tomatoes with a production of 1,982 tonnes (58% of the total fruit and vegetables produced) followed by cabbage (511t, 15%) and amaranths (352t, 10%). The production of the other fruit and vegetables crops was relatively small.

iv) Permanent Crops

The area planted with permanent crops by smallholders was 24,734 hectares (4% of the area planted with annual and permanent crops in the region). The most important permanent crop in Dodoma region is pigeon pea which accounts for a planted area of 19,678 ha, (80% of the planted area of all permanent crops), followed by bananas (1,786 ha, 7%), guava (1,225 ha, 5%), mango (669 ha, 3%), sugar cane (598 ha, 2%), pawpaw (312 ha, 1%) and grape (278 ha, 1%).

v) Inputs/Implement Use

Methods of Soil Preparation

Hand cultivation is mostly used for soil preparation and it has been used on an area of 432,437 ha which represents 66 percent of the total planted area, followed by ox-ploughing (157,101 ha, 24%) and tractor ploughing (62,555 ha, 10%).

Improved Seeds

The planted area using improved seeds was estimated at 85,495 ha which represents 13 percent of the total area planted with the annual crops and vegetables. The percentage use of improved seed in the wet season was 13 percent, is much higher than the corresponding percentage use for the dry season (1.3%).

Use of Fertilisers

The use of fertilisers on annual crops is very small with a planted area of only 166,015 ha (25.2% of the total planted area in the region). The planted area without fertiliser for annual crops was 492,963 hectares representing 74.8 percent of the total planted area with annual crops. Of the planted area with fertiliser application, farm yard manure was applied to 155,984 ha which represents 23.7 percent of the total planted area in the region (94% of the area planted with fertiliser application in the region), followed by compost (1.2% of the total planted area in the region or 4.8% of the area planted with fertiliser application in the region) and inorganic (0.3% of the total planted area in the region or 1.8% of the area planted with fertiliser application in the region).

Pesticide Use

Insecticides are the most common pesticide used in the region (60% of the total planted area applied with pesticides). This was followed by fungicides (23%) and herbicides (17%). The planted area applied with insecticides was 24,511 ha which represents 3.7 percent of the total planted area for annual crops and vegetables. The planted area applied with herbicides was 6,915 ha which represented 11 percent of the total planted area annual crops and vegetables. The planted area applied with fungicides was 9,252 ha which represented 1.4 percent of the total planted area for annual crops and vegetables.

vi) Irrigation

In Dodoma region, the area of annual crops under irrigation was 12,074 ha representing 2 percent of the total area planted. The area under irrigation during the dry season was 15 ha accounting for 0.12 percent of the total area under irrigation. Cabbage is the only crop that was irrigated during the dry season.

vii) Crop Storage, Processing and Marketing

Crop Storage

There were 288,389 crop growing households (89% of the total crop growing households) that stored various agricultural products in the region.

The most important stored crop was maize with 133,858 households storing 37,052 tonnes as of 1st January 2004. This was followed by sorghum and millet (71,917 households, 9,743t), groundnuts and bambaranuts (64,253 households, 4,084t), pulses (16,974 households, 793t) and paddy (1,388 households, 276t). Other crops were stored in very small amounts.

Processing

Agro-processing was practiced in most crop growing households in Dodoma region (296,901 households, 92% of the total crop growing households). The percent of households processing crops was very high in most districts (above 80%). Dodoma Rural district had the lowest percent of households processing crops (88% of crop growing households respectively). The most common method of processing in the region was by neighbours machines.

Crop Marketing

The number of households that reported selling crops was 190,800 which represent 59.1 percent of the total number of crop growing households. The percent of crop growing households selling crops was highest in Kondoa (74.2%) followed by Mpwapwa (65.0%), Dodoma Rural (54.4%), Kongwa (51.7%) and Dodoma Urban (40%).

viii) Access to Crop Production Services

Access to Agricultural Credits

In Dodoma region very few agricultural households (1,759, 0.5%) accessed credit out of which 1,493 (85%) were maleheaded households and 266 (15%) were female headed households. In Kongwa, Dodoma Rural and Dodoma Urban districts, only female headed households got agricultural credit whereas in Kondoa and Mpwapwa both male and female headed households accessed agricultural credits.

Crop Extension Services

The number of Agricultural households that received crop extension was 132,389 (41% of total crop growing households in the region). Some districts have more access to extension services than others, with Kongwa having a relatively high proportion of households that received crop extension messages in Dodoma region (56.0%), followed by Dodoma Urban (52.3%), Dodoma Rural (51.8%), Mpwapwa (32.9 and Kondoa (19.0%).

ix) Access to Inputs

In Dodoma region farm yard manure was used by 96,837 households which represent 30.0 percent of the total number of crop growing households. This is followed by households using improved seeds (10.6%), pesticide/fungicide (2.8%) compost (1.4%), inorganic fertiliser (0.7%) and herbicide (0.1%).

x) Tree Planting

The number of households involved in tree farming was 22,308 representing 7 percent of the total number of agriculture households. The number of trees planted by smallholders on their allotted land was 1,459,972 trees. The average number of trees planted per household that plants trees on their land was 65 trees.

xi) Irrigation and Erosion Control Facilities

The number of agricultural households that had soil erosion and water harvesting facilities on their farms was 33,336 which represent 10 percent of the total number of agricultural households in the region. The proportion of households with soil erosion control and water harvesting facilities was highest in Kondoa district (28%) followed by Mpwapwa (5%), Dodoma Urban (4%), Dodoma Rural (4%) and Kongwa (3%).

xii) Livestock Results

Cattle

The total number of cattle in Dodoma region was 1,031,889. Cattle are the dominant livestock type in the region followed by goats, sheep and pigs. The region had 6.1 percent of the total cattle population on Tanzania Mainland. The number of indigenous cattle in Dodoma region was 1,025,388 (99.4 % of the total number of cattle in the region), 4,645 cattle (0.5%) were improved dairy breeds and 1,856 cattle (0.2%) were improved beef breeds.

Goats

The number of goat-rearing households in Dodoma region was 63,964 (19.7% of all agricultural households in the region) with a total of 797,481 goats giving an average of 12.5 head of goats per goat-rearing household.

Sheep

The number of sheep-rearing households was 23,680 (7.3% of all agricultural households in Dodoma region) rearing 187,244 sheep, giving an average of 8 heads of sheep per sheep-rearing household.

Pigs

The number of pig-rearing agricultural households in Dodoma region was 14,859 (4% of the total agricultural households in the region) rearing 43,835 pigs. This gives an average of 3 pigs per pig-rearing household.

Chicken

The number of households keeping chicken was 139,992 raising about 1,825,867 chickens. This gives an average of 13 chickens per chicken-rearing household. In terms of total number of chickens in the country, Dodoma region was ranked eighth out of the 21 Mainland regions.

Pests and Parasites Incidences and Control

The results indicate that 42 percent and 13 percent of the total livestock-keeping households reported to have encountered ticks and tsetse fly problems respectively. While incidences of ticks problems were highest in Mpwapwa district and lowest in Kongwa district, tseflies incidences were highest in Kondoa but lowest in Dodoma Urban district.

Access to Livestock Services

The total number of households that received livestock advice was 34,318, representing 38 percent of the total livestockrearing households and 11 percent of the agricultural households in the region. The main livestock extension agent was the government which provided service to about 22 percent of all households receiving livestock extension services, closely followed by NGOs/development projects (21%), cooperatives (19%) and large-scale farmers (19%).

Many veterinary clinics were located far from livestock rearing households. About 62 percent of the livestock rearing households accessed the services, at a distance of more than 14 kms. Only 38 percent of them accessed the services within 14 kms from their dwellings.

The number of livestock rearing households residing less than 5 kms from the nearest watering point was 31,168 (82% of livestock rearing households in Dodoma region) whilst 4,539 households (12%) resided between 5 and 14 kms. However, 2,169 households (6%) had to travel a distance of 15 or more kms to the nearest watering point.

Animal Contribution to Crop Production

Use of draft animals for land cultivation in Dodoma region is moderate with 53,937 households (17% of the total households in the region) using them. The number of households that used draft animals in Kondoa district was 30,654 representing 56.8 percent of the households using draught animals in the region followed by Dodoma Rural (9,195 households, 17.0%), Kongwa (6,309 households, 11.7%), Mpwapwa (5,908 households, 11.0%) and Dodoma Urban (1,870 households, 3.5%).

The total area applied with organic fertiliser was 92,594 ha of which 88,456 hectares was applied with farm yard manure (95.5% of the total area applied with organic fertiliser or 14% of the area planted with annual crops and vegetables in Dodoma region).

Fish Farming

The number of households involved in fish farming in Dodoma region was 129, representing 0.04 percent of the total agricultural households in the region. Mpwapwa was the only district in the region practicing fish farming.

xiii) Poverty Indicators

Type of Toilets

About 90.9 percent of all rural agricultural households in Dodoma region used traditional pit latrines, 1.3 percent used improved pit latrine and 0.1 percent had flush toilets. The remaining 1.0 percent of households had other unspecified types of toilets. However, households with no toilet facilities represent 6.2 percent of the total agriculture households in the region and most of these are found in Dodoma Rural district.

Household Assets

Radios are owned by most rural agricultural households in Dodoma region with 158,476 households owning the asset (49.0% of total agricultural households in the region), followed by bicycle (32.5%), iron (12.8%), wheelbarrow (2.7%), vehicle (0.7%) mobile phone (0.6%), television/video (0.6%), and landline phone (0.4%).

Source of Lighting Energy

xii

Wick lamp is the most common source of lighting energy in the region with 72 percent of the total rural households using this source of energy followed by hurricane lamp (16%), firewood (9%), pressure lamp (2%), main electricity (0.6%), candle (0.4%), gas (biogas) (0.2%) and solar (0.1%).

Energy for Cooking

The most prevalent source of energy for cooking was firewood, which was used by 96.2 percent of all rural agricultural households in Dodoma region. This is followed by charcoal (2.15%) and crop residues (0.84%). The rest of the energy sources accounted for 0.81 percent. These were livestock dung (0.16%), Solar (0.15%), paraffin/kerosene (0.15%), biogas (0.14%), main electricity (0.13%) and bottled gas (0.08%).

Roofing Materials

The most common material used for roofing of the main dwelling was grass and mud and it was used by 51.9 percent of the rural agricultural households. This was closely followed by iron sheets (39.0%), grass/leaves (7.7%), tiles (0.6%), asbestos (0.5%), concrete (0.1%) and others (0.2%)

Sources of Drinking Water

The main source of drinking water for rural agricultural households in Dodoma region was piped water (36% of households use piped water during the wet season and 50% of the households during the dry season). This is followed by unprotected wells (28% of households during the wet season and 28% in the dry season), unprotected spring (8.6% of households in the wet season and 9.1% during the dry season) and protected wells (8.2% of households using the source in the wet season and 8.8% in the dry season).

Food Consumption Pattern

The majority of households in Dodoma region normally have 2 meals per day (69.8 percent of the households in the region). This is followed by 3 meals per day (25.5 percent) and 1 meal per day (4.5 percent). Only 0.1 percent of the households have 4 meals per day.

The number of agricultural households that consumed meat during the week preceding the census was 208,654 (64% of the agricultural households in Dodoma region) with 115,314 households (55.3 % of those who consumed consuming meat only once during the respective week). This was followed by those who had meat twice during the week (30.0%). Very few households had meat four times or more during the respective week.

The number of agricultural households that consumed fish during the week preceding the census was 138,561(42.8% of the total agricultural households in Dodoma region). Of these households 38,764 households consumed fish twice during the week (28.0 % of those who consumed fish in the region). This was followed by those who had fish three times (7.4%). About 57.2 percent of the agricultural households in Dodoma region did not eat fish during the week preceding the census.

Food Security

About 32.6 percent of the agricultural households said they did not experience any problems in satisfying their food requirements, whilst 34 percent of them rarely experienced food sufficiency problems. However, of the remaining 33.4 percent of the households, 26 percent experience food sufficiency problems on a regular basis.

Main Source of Cash Income

The main cash income of the households in Dodoma region was from casual cash earnings (35.4 percent of smallholder households), followed by selling of food crops (14.7%), businesses (13.5%), selling of cash crops (13.1%), and sale of livestock (8.8%). Only 6.1% of smallholder households reported the sale of forest product as their main source of income, followed by cash remittance (4.6%), wages and salaries (2.2%), sale of livestock products (0.8%) and fishing (0.5%).

1. BACKGROUND INFORMATION

1.1 Introduction

This part of the report presents a brief description of the regional profile by providing information on geographical location, land area, climate, administrative set up, population and socio-economic indicators. The information will provide the user with a general understanding of the potential of the region and its resources.

1.2 Geographical Location and Boundaries

Dodoma region is centrally positioned in Tanzania mainland. The region lies between latitude 4^0 and 7^0 (degrees) South Latitude and $35^0 - 37^0$ (degrees) East Longitude. Four regions border Dodoma regions as follows: To the north, Dodoma region shares boarders with Arusha and to the East with Morogoro region. In the south it shares boarders with Iringa region and to the west, it shares borders with Singida region. Much of the region is plateau rising gradually from some 830 meters in Bahi swamps to 2,000 meters above sea level in the highlands North of Kondoa.

1.3 Land Area

Dodoma region is ranked 12th largest among the regions in Tanzania Mainland and covers an area of 41,310 square kilometers (equivalent to about 5% of the total area of Tanzania Mainland), of which 35,309 square kilometers are potential land (which is 85% of regions total land area).

1.4 Climate

Dodoma region has a dry savanna type of climate, which is characterized by a long dry season lasting between late April to early December and a short single wet season during the remaining months. The region lies in a rain shadow behind the mountains area of Dodoma in the eastern side.

1.4.1 Temperature

Temperature in the region varies according to altitude but generally the average maximum and minimum for October to December are 31^{0} C and 18^{0} C (degrees Centigrade) respectively. The corresponding figures for the cool dry season of June – August are 27^{0} C to 28^{0} and 10^{0} to 11^{0} C (degree centigrade).

1.4.2 Rainfall

The average rainfall for Dodoma town is 570mm, and about 85% of this falls in four months between December and March. Rainfall is somewhat higher in the more agriculturally productive parts of Mpwapwa and Kondoa districts.

Rainfall in Dodoma region is not only low but it is rather unpredictable in frequency and amount, particularly in the month of January in which most crops are generally sown.

1.5 Administrative Setup

Dodoma region is divided into five administrative districts as follows: Dodoma Rural with total land of 5,951 square kilometers (36% of the total region land area), Dodoma Urban (Municipality) has a total land area of 795 square kilometers (5%), Kondoa district occupies a total land area of 5,092 square kilometers (31%), Mpwapwa district with a total land of 3,284 square (20%) and Kongwa district 1,272 square kilometers (8%).

1.6 Population

According to the 2002 Population and Housing Census, there were 1,698,996 inhabitants in Dodoma region and an average household size of 4.5 persons. The population of Dodoma region ranked eighth of the 21 regions in Tanzania. The annual Average Population growth rate (1988 – 2002) was 2.3 percent.

1.7 Socio - Economic Indicators

The regional Gross Domestic Product (GDP) at current prices for the year 2003 was estimated to be TShs 325,233 million. The region held 16^{th} position among regions on GDP and contributed about 3.3 percent to the national GDP¹

• Food Crops

Food crops grown in Dodoma region are sorghum, maize, paddy, beans, bulrush millet, groundnuts and finger millet.

Cash Crops

Cash crops grown are sunflower and simsim.

Livestock

Dodoma region is almost entirely dependent on agriculture and animal husbandry, which are practiced in rural areas at subsistence level. It is also one of the regions with large numbers of livestock including cattle, goats, sheep, poultry and pigs.

¹ National Bureau of Statistics

2. INTRODUCTION

This part of the report provides the technical and operational description of the National Sample Census of Agriculture (NSCA), carried out in the rural areas of Tanzania Mainland and Zanzibar during the 2002/03 agricultural year. It details the background and the rationale for carrying out the NSCA in 2002/03 agricultural year. It also explains the sampling procedures, designing and implementation of the data processing system.

2.1 The Rationale for Conducting the National Sample Census of Agriculture

In 2003, the Government of Tanzania launched the Agricultural Sample Census as an important part of the Poverty Monitoring Master Plan which supports the production of statistics for advocacy of effective public policy, including poverty reduction, access to services, gender, as well as the standard crop production data normally collected in an agriculture census. The census is intended to fill the information gap and support planning and policy formulation by high level decision making bodies. It is also meant to provide critical benchmark data for monitoring Agriculture Sector Development Programme (ASDP) and other agriculture and rural development programs as well as prioritising specific interventions of most agriculture and rural development programs.

Following the decentralisation of the Government's administration and planning functions, there has been a pressing need for agriculture and rural development data disaggregated at regional and district levels. The provision of district level estimates will provide essential baseline information on the state of agriculture and support decision making by the local government authorities in the design of District Agricultural Development and Investment Projects (DADIPS). The increase in investment is an essential element in the national strategy for growth and reduction of poverty.

This report (Volume V) is among the 21 regional reports for the Mainland. Other Census reports include the Technical Report (Volume I), Crop Sector at national and regional levels including Zanzibar estimates (Volume II), Livestock Report (Volume III), Smallholder Household Characteristics and Access to Natural Resources Report (Volume IV), 21 Regional Reports for the Mainland (Volume V), Large Scale Farms Report (Volume VI) and a separate report for Zanzibar (Volume VII). In order to address the specific issue of gender, a separate thematic report on gender has been published. Other thematic reports will be produced depending on the demand and availability of funds. In addition to these reports two dissemination applications have been produced to allow users to create their own tabulations, charts and maps.

The report is divided into five main sections: Background Information, Introduction, Results, Dodoma profiles (Regional and Districts) and Appendices. The definitions relating to all aspects of this report can be found in the questionnaire (Appendix III).

2.2 Census Objectives

The 2003 Agriculture Sample Census was designed to meet the data needs of a wide range of users down to district level including policy makers at local, regional and national levels, rural development agencies, funding institutions, researchers, non-government organisations (NGOs), farmer organisations, etc. As a result, the dataset is both more numerous in its sample and detailed in its scope compared to previous censuses and surveys. To date this is the most detailed Agricultural Census carried out in Africa. The census was carried out in order to:

- Identify structural changes if any, in the size of farm household holdings, crop and livestock production, farm input and implement use. It also seeks to determine if there are any improvements in rural infrastructure and in the level of agriculture household living conditions;
- Provide benchmark data on productivity, production and agricultural practices in relation to policies and interventions promoted by the Ministry of Agriculture and Food Security and other stake holders.
- Establish baseline data for the measurement of the impact of high level objectives of the Agriculture Sector Development Programme (ASDP), National Strategy for Growth and Reduction of Poverty (NSGRP) and other rural development programs and projects.
- Obtain benchmark data that will be used to address specific issues such as: food security, rural poverty, gender, agroprocessing, marketing, service delivery, etc.

2.3 Census Coverage and Scope

The census was conducted for both large and small scale farms. The National Sample Census of Agriculture covered a total of 3,221 selected rural villages of Tanzania Mainland out of which 151 villages were from Dodoma region.

The census covered agriculture in detail as well as many other aspects of rural development and was conducted using three types of questionnaires:

- Small scale farm questionnaire
- Community level questionnaire
- Large scale farm questionnaire

The small scale farm questionnaire was the main census instrument and it includes questions related to crop and livestock production and practices; population demographics; access to services, resources and infrastructure; issues on poverty, gender and subsistence versus profit making production units. The main sections covered are as follows:

- Identification (i.e. region, district, ward and village)
- Household and holding characteristics
- Household information
- Land ownership/tenure
- Land use
- Access and use of resources
- Crop and vegetable production
- Agro processing and by-products
- Crop storage and marketing
- On-farm investment
- Access to farm inputs and implements
- Use of credit for agricultural purposes
- Tree farming/agro-forestry
- Crop extension services
- Livelihood constraints
- Animal contribution to crop production
- Livestock

- Livestock products
- Fish farming
- Livestock extension
- Labour use
- Access to infrastructure and other services
- Household facilities

The community level questionnaire was designed to collect village level data such as access and use of common resources, community tree plantation and seasonal farm gate prices.

The large scale farm questionnaire was administered to large scale farms that were either privately or corporately managed. There will be a national report on large scale farming on Tanzania Mainland.

2.4 Legal Authority of the National Sample Census of Agriculture

The NSCA 2002/03 was conducted under the legal authority of the Statistics Act 2002, among other things, makes data collected from individuals strictly confidential and to be used for statistical purposes only.

2.5 Reference Period

Two types of reference periods were used namely the agricultural year and the reference date for livestock enumeration. The agricultural year 2002/03 (that is October 2002 to September 2003) was used for the data items that are related to crop production. The reference date of enumeration for livestock and poultry count was 1^{st} October 2003.

2.6 Census Methodology

The main focus at all stages of the census execution was on data quality and this is emphasised in this section. The main activities undertaken include:

- Census organisation
- Tabulation plan preparation
- Sample design
- Design of census questionnaires and other instruments.
- Field pretesting of the census instruments
- Training of trainers, supervisors and enumerators
- Information Education and Communication (IEC) campaign
- Data Collection
- Field supervision and consistency checks
- Data processing:
 - Scanning
 - ICR extraction of data
 - Structure formatting application
 - Batch validation application

Manual data entry application

Tabulation preparation using SPSS

- Table formatting and charts using Excel and map generation using Mapinfo.
- Report preparation using Word and Excel.

2.6.1 Census Organization

The Census was conducted by the National Bureau of Statistics in collaboration with the sector ministries of agriculture, and the Office of the Chief Government Statistician in Zanzibar. At the national level the Census was headed by the Director General of the National Bureau of Statistics with assistance from the Director of Economic Statistics. The Planning Group, made up of staff from the National Bureau of Statistics, Department of Agricultural Statistics and three representatives from the Ministry of Agriculture and Food Security (Department of Policy and Planning), oversaw the overall operational aspects of the Census. At the regional level, implementation of census activities was overseen by the Regional Statistical Officer of NBS and the Regional Agriculture Supervisor from the Ministry of Agriculture and Food Security (Department of Agriculture and Food Security. At the District level, two supervisors from the President's Office, Regional Administration and Local Government (PORALG), managed the enumerators who also came from the same ministry.

Members of the Planning Group had a minimum qualification of a bachelor degree, the regional supervisors were either agricultural economists, statisticians or statistical officers. The district supervisors and enumerators had diploma level qualifications in agriculture.

The Census and Surveys Technical Working Group provided support in sourcing financing, approving budget allocations and technical assistance inputs as well as monitoring the progress of the census. A Technical Committee for the census was established with members from key stakeholder organisations (i.e. NBS, sector ministries of agriculture, President's Office, Planning and Privatization (POPP), PORALG, University of Dar es Salaam (UDSM), Tanzania Food and Nutrition Centre (TFNC) and the Office of Chief Government Statistician (OCGS) in Zanzibar). The main function of the committee was to approve the proposed instruments and procedures developed by the Planning Group. It also approved the tabulations and analytical reports prepared from the census data.

2.6.2 Tabulation Plan

The tabulation plan was developed following three user group workshops and thus reflects the information needs of the end users. It took into consideration the tabulations from previous census and surveys to allow trend analysis and comparisons.

2.6.3 Sample Design

The Mainland sample consisted of 3,221 villages. These villages were drawn from the National Master Sample (NMS) developed by the National Bureau of Statistics (NBS) to serve as a national framework for the conduct of household based surveys in the

Table 2.1. Census Sample Size				
Number of	Mainland	Zanzibar	Total	
Households	48,315	4,755	53,070	
Villages/Eas	3,221	317	3,539	
Districts	117	9	126	
Regions	21	5	26	

Table 2 1. Census Samule Size

country. The National Master Sample was developed from the 2002 Population and Housing Census. In most cases, within each selected village, data was collected from a sub-sample of fifteen agricultural households. In few large villages thirty households were selected. The total Mainland sample was 48,315 agricultural households. In Zanzibar a total of 317 EAs

were selected and 4,755 agricultural households were covered. Nationwide, all regions and districts were sampled with the exception of three urban districts (two from Mainland and one from Zanzibar).

In both Mainland and Zanzibar a stratified two stage sample was used. In the first stage, villages/enumeration areas (EAs) were selected with probability proportional to the number of villages in each district. In the second stage, 15 households were selected from a list of farming households in each Village/EA using systematic random sampling. Table 2.1 gives the sample size of households, villages and districts for Tanzania Mainland and Zanzibar.

2.6.4 Questionnaire Design and Other Census Instruments

The census questionnaires were designed following user/producer meetings to ensure that the information collected was in line with their data needs. Several features were incorporated into the design of the questionnaire to increase the accuracy of the data:

- Where feasible all variables were extensively coded to reduce post enumeration coding error.
- The definitions for each section were printed on the opposite page so that the enumerator could easily refer to the instructions whilst interviewing the farmer.
- The responses to all questions were placed in boxes printed on the questionnaire, with one box per character. This feature made it possible to use scanning and ICR technologies for data entry.
- Skip patterns were used to avoid asking unnecessary questions
- Each section was clearly numbered, which facilitated the use of skip patterns and provided a reference for data type coding for the programming of CSPro, SPSS and the dissemination applications.

Besides the questionnaires, there were other instruments used:

- Village listing forms that were used for listing households in the villages and from these list a systematic sample of 15 agricultural households were selected from each village.
- Training manual which was used by the trainers for the cascade/pyramid training of supervisors and enumerators. This manual was the trainers' guiding document on the procedures to follow during tha training
- Enumerator Instruction Manual which was used as reference material.

2.6.5 Field Pre-Testing of the Census Instruments

The Questionnaire was pre-tested in five locations (Arusha, Dodoma,,Tanga, Unguja and Pemba). This was done for the purpose of testing the wording, flow and relevance of the questions and to finalise crop lists, questionnaire coding and manuals. In addition to this, several data collection methodologies had to be finalised, namely, livestock numbers in pastoralist communities, cut flower production, mixed cropping, use of percentages in the questionnaire and finalising skip patterns and documenting consistency checks.

2.6.6 Training of Trainers, Supervisors and Enumerators

Cascade/pyramid training techniques were employed to maintain statistical standards. The top level training was provided to 66 national and regional supervisors (3 per region plus Zanzibar). The trainers were members of the Planning Group and the trainees were from the National Bureau of Statistics and the sector ministries of agriculture. The second level training was for the district supervisors and enumerators. This training was conducted in the regions. In each region three training

sessions were conducted for the district supervisors and enumerators. In addition to training in field level Census methodology and definitions, emphasis was placed on training the enumerators and supervisors in consistency checking. Tests were given to the enumerators and supervisors and the best 50 percent of the trainees were selected to administer the smallholder and community level questionnaires. This increased the number of interviews per enumerator but it also released finance to increase the number of supervisors and hence the Supervisor Enumerator Ratio. The household listing exercise was carried out by all trained enumerators.

2.6.7 Information, Education and Communication (IEC) Campaign

Information, Education and Communication (IEC) is an important aspect of any census/survey undertaking. This is due to the fact that inadequately informed and hence uncooperative citizens may jeopardize the entire census/survey. As far as the 2002/03 Agricultural Sample Census was concerned, the main objective of the IEC program was to sensitize and mobilize Tanzanians to support, cooperate and participate in the census exercise.

Radio, television, newspapers, leaflets, t-shirts and caps were used to publicise the Sample Census. T-shirts and caps were used by the field staff and the village chairmen as official uniforms during the field work. The village chairmen helped to locate the selected households.

2.6.8 Household Listing

The household listing exercise was done in seven days. During the listing exercise, forms ACLF1 and ACLF2 were administered. The information collected included the number of fields operated by the household, the number of different types of livestock and poultry. This information was used to determine the agricultural households. From the list of agricultural households, 15 households were selected for the interview. The selection was done using the Random Number Table.

2.6.9 Data Collection

Data collection activities for the 2002/2003 Agricultural Sample Census took three months from January to March 2004. The data collection methods used during the census were by interview and no physical measurements, e.g., crop cutting and field area measurement were taken. Field work was monitored by a hierarchical system of supervisors at the top of which was the Mobile Response Team followed by the national, regional, and district supervisors.

The Mobile Response Team consisted of three principal supervisors who provided overall direction to the field operation and responded to queries arising outside the scope of the training exercise. The mobile response team consisted of the Manager of Agriculture Statistics Department, Long-term Consultant and Desk Officer for the Census. Decisions made on definitions and procedures were then communicated back to all enumerators via the national, regional and district supervisors.

District supervision and enumeration were done by staff from the President's Office, Regional Administration and Local Government (PORALG). National and regional supervisions were provided by senior staff of the National Bureau of Statistics and the sector ministries of agriculture. During the household listing exercise 3,221 extension staff were used. For the enumeration of the small holder questionnaire, 1,611 enumerators were used and additional 5 percent enumerators were held in reserve in case of drop outs during the enumeration exercise.

2.6.10 Field Supervision and Consistency Checks

Enumerators were trained to probe the respondents until they were satisfied with the responses given before they recorded them in the questionnaire. The first check of the questionnaires was done by enumerators in the field during enumeration. The second check was done by the district supervisors followed by regional and national supervisors. Supervisory visits at all levels of supervision focused on consistency checking of the questionnaires. Inconsistencies encountered were corrected, and where necessary a return visit to the respondent was made by the enumerator to obtain the correct information. Further quality control checks were made through a major post enumeration checking exercise where all questionnaires were checked for consistencies by all supervisors in the district offices.

2.6.11 Data Processing

Data processing consisted of the following processes:

- Manual editing
- Data entry
- Data structure formatting
- Batch validation
- Tabulation
- Illustration production
- Report formatting

Manual Editing

Prior to scanning, all questionnaires underwent a manual cleaning exercise. This involved checking that the questionnaire had a full set of pages, correct identification and good handwriting. A score was given to each questionnaire based on the legibility and the completeness of enumeration. This score will be used to assess the quality of enumeration and supervision in order to select the best field staff for future censuses/surveys.

Data entry/Scanning and ICR extraction technologies

Scanning and ICR data capture technology was used for the small holder questionnaire. This not only increased the speed of data entry, it also increased the accuracy due to the reduction in keystroke errors. Interactive validation routines were incorporated into the ICR software to track errors during the verification process. The scanning operation was so successful that it is highly recommended that this technology be adopted for future censuses/surveys.

The Census and Surveys Processing Program (CSPro) was used to enter 2,880 of small holder questionnaires that were rejected by the Intelligent Character Recognition (ICR) extraction application.

Data structure formatting

A program was developed in visual basic to automatically alter the structure of the output from the scanning/extraction process in order to harmonise it with the manually entered data. The program automatically checked and changed the number of digits for each variable, the record type code, the number of questionnaires in the village, the consistency of the Village Identification (ID) code and saved the data of one village in a file named after the village code.

Batch validation

A batch validation program was developed in order to identify inconsistencies within a questionnaire. This is in addition to the interactive validation during the ICR extraction process. The procedures varied from simple range checking within each variable to more complex checking between variables. It took six months to screen, edit and validate the data from the smallholder questionnaire. After the long process of data cleaning, the results were prepared based on a pre-designed tabulation plan.

Tabulations

Statistical Package for Social Sciences (SPSS) was used to produce the Census results and Microsoft Excel was used to organize the tables and compute additional indicators.

Analysis and report preparation

The analysis in this report focuses on regional and district production estimates, districts comparisons and time series analysis. Microsoft Excel was used to produce charts; whereas Microsoft Word was used to compile the report.

Data quality

A great deal of emphasis was placed on data quality throughout the whole exercise from planning, questionnaire design, training, supervision, data entry, validation and cleaning/editing. As a result of this NBS believes that the Census is highly accurate and representative of what was experienced at field level during the Census year. With very few exceptions the variables in the questionnaire are within the norms for Tanzania and they follow expected time series trends when compared to historical data. Standard Errors and Coefficients of Variation for the main variables can be found in the Technical Report (Volume I).

2.7 Funding Arrangements

The Agricultural Sample Census was supported mainly by the European Union (EU) who financed most of the operational activities. Other funds for operational activities came from the Government of Tanzania, Government of Japan, United Nations Development Programme (UNDP) and other partners in the Pool Fund of the Vice President's Office (VPO). In addition to this, technical assistance was provided by the European Union (EU), Department for International Development (DFID) and Japanese International Cooperation Agency (JICA). Technical assistance were managed by Ultek Laurence Gould Consultants (ULG), Scotts Agriculture Consultancy (SAC) and the Food and Agriculture Organisation (FAO).

PART III: CENSUS RESULTS AND ANALYSIS

This part of the report presents the results of the census data for Dodoma Region which are based on the data tables presented in Appendix II. The results are presented in different forms including brief summaries, charts, condensed tables, graphs and maps in order to make it easier for the users to understand. Comparisons are made between related variables and between districts. Comparisons are also made with past censuses/surveys results such as the 1994/95 National Sample Census of Agriculture (NSCA), the 1995/96 and the 1996/97 Expanded Agricultural Surveys, the 1997/98 Integrated Agricultural Survey, the 1998/99 District Integrated Agricultural Survey and the 1999/00 Rapid Agricultural Appraisal Survey. The presentation of results is divided into four main sections which are household characteristics, crop results, livestock results and poverty indicators. More effort has been placed in analyzing the results and in the preparation of district profiles than in previous censuses and surveys.

3.1 Household Characteristics

3.1.1 Type of Households

The number of agricultural households in Dodoma region was 323,719 out of which 233,709 (72.2%) were involved in growing crops only, 608 (0.2%) were involved in livestock keeping only and 89,402 (27.6%) were involved in crop production as well as livestock keeping. There were no pastoralists in the region (Chart 3.1 and Maps 3.1, 3.2, 3.3 and 3.4, 3.5 and 3.6).

3.1.2 Livelihood Activities/Source of Income

The census results for Dodoma region indicate that most of the agricultural households ranked annual crop farming as the activity that provides most of their cash income followed by off farm income, tree/forest resources, livestock keeping/herding, remittances, permanent

crop farming and fishing/hunting and gathering (Table 3.1).

3.1.3 Sex and Age of Heads of Households

The number of male-headed agricultural households in Dodoma region was 253,566 (78% of the total regional agricultural households) while female-headed households was 70,153 (22%). The percentage trend for six censuses/surveys show that there has

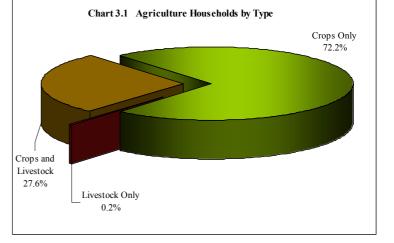

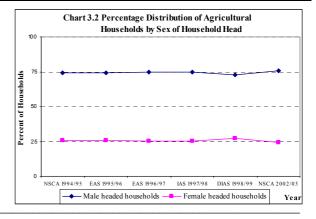

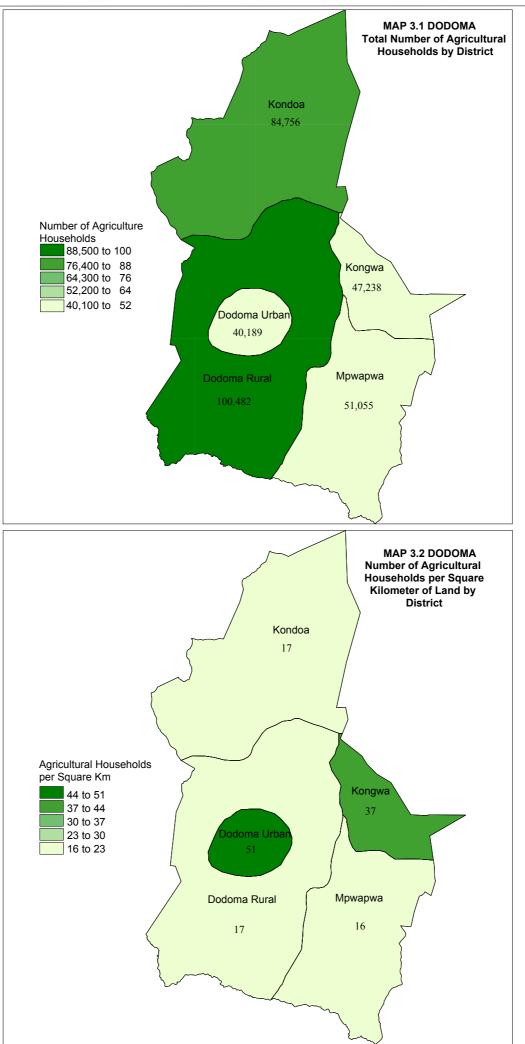

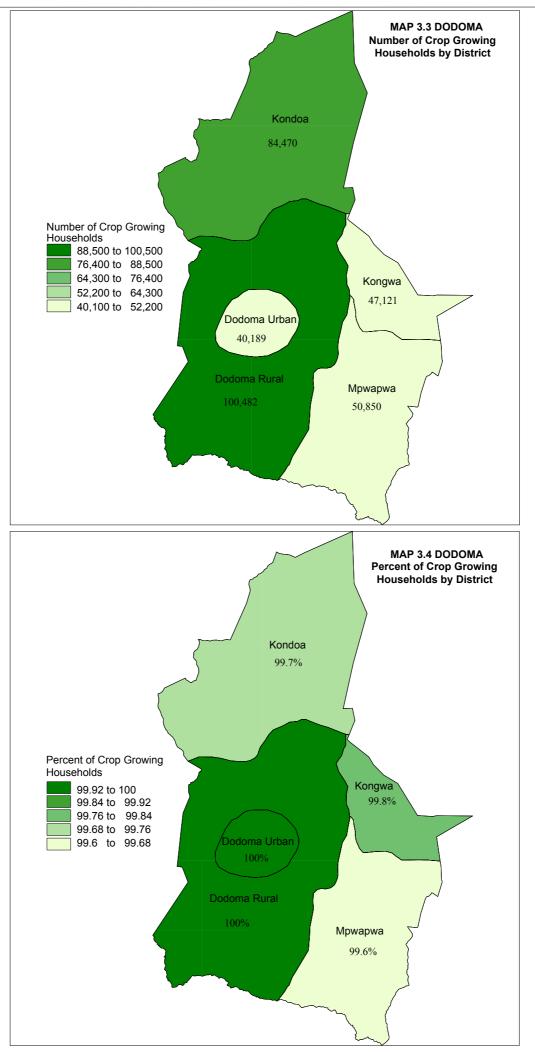

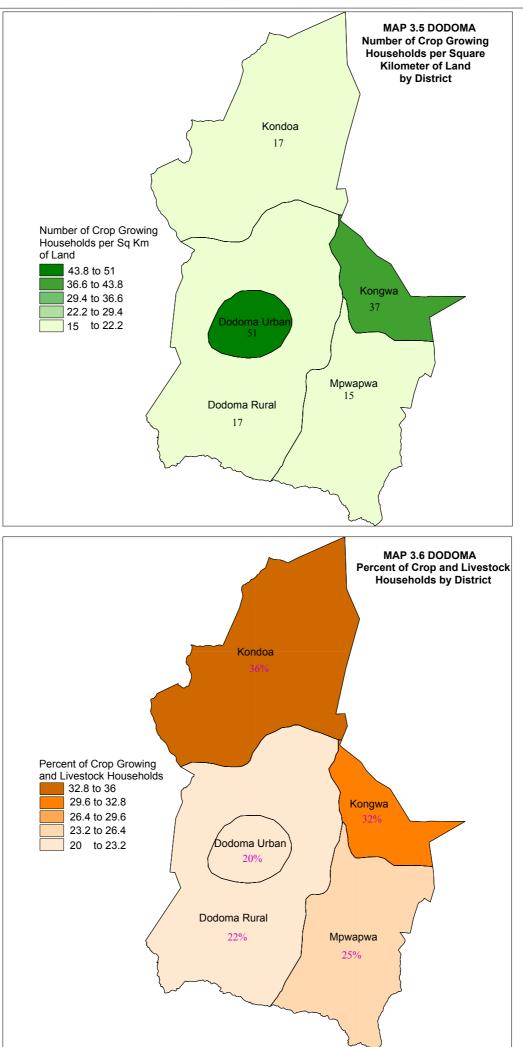

Table 3.1 Rank in Order of Importance Livelihood Activities/Source of Income of the Household in Order of Importance By District

District	Livelihood Activity						
	Annual	Permanent	Livestock	Off Farm	Remittances	Fishing /	Tree /
	Crop	Crop	Keeping /	Income		Hunting &	Forest
	Farming	Farming	Herding			Gathering	Resources
Kondoa	1	6	4	2	5	7	3
Mpwapwa	1	7	4	2	5	6	3
Kongwa	1	6	4	2	5	7	3
Dodoma Rural	1	6	4	2	5	7	3
Dodoma Urban	2	6	4	1	5	7	3
Total	1	6	4	2	5	7	3

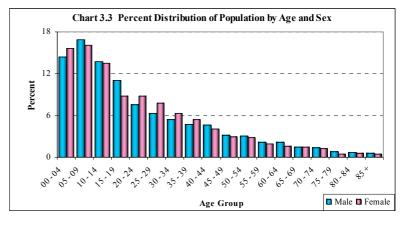

Tanzania Agriculture Sample Census

not been any significant change in the distribution of agricultural households between male and female headed households (Chart 3.2). The mean age of household heads is 45 years (44 years for male heads and 49 years for female heads).

3.1.4 Number and Age of Household Members

Dodoma region had a total rural agricultural population of 1,504,645 of which 735,628 (49%) were males and 769,019 (51%) were females. The population of the 0-14 age group was 678,649 representing 45 percent of the total rural agricultural population. Age group 15–64 (active population) was 756,851 which is equivalent to 50 percent. Dodoma region had an average household size of 4.6 with Dodoma Rural district having the lowest household size of 4.2 (Chart 3.3).

3.1.4 Level of Education

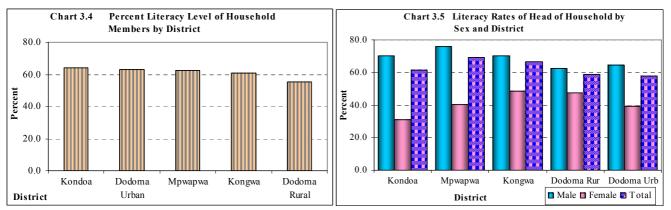

In order to obtain information on the level of education, information on literacy and education attainment were obtained for all persons aged five years and above in all households.

Literacy

The information on literacy level for family members aged five years and above was obtained by asking individual private households if their respective family members could read and write in Kiswahili only, English only, both English and Swahili or in any other language. Literacy is based on the ability to read and write Swahili, English or other other languages.

Literacy Level for Household Members

Dodoma region had a total literacy rate of 60.6 percent. The highest literacy rate was found in Kondoa district (64.1%) followed by Dodoma Urban district (62.8%) and Mpwapwa district (62.7%) and Kongwa (60.7%). Dodoma Rural district had the lowest literacy rate of 55.4 percent (Chart 3.4).

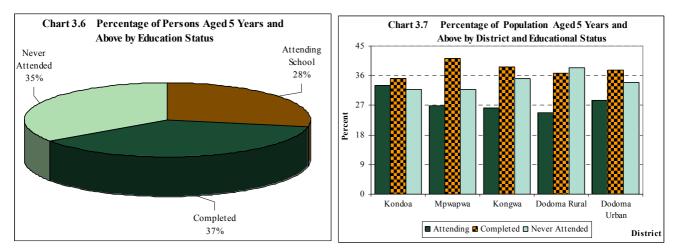

The literacy rate for the heads of households in the region was 62.1 percent. The literacy rates among the male and female heads of households were 68.0 and 40.9 percent respectively. The male head of household literacy rate was higher than that of females in all districts. The district with the highest literacy rate amongst heads of households was Mpwapwa (69.0%) followed by Kongwa (66.7%), Kondoa (61.2%), Dodoma Rural (59.0%) and Dodoma Urban (58.0%) (Chart 3.5).

Educational Status

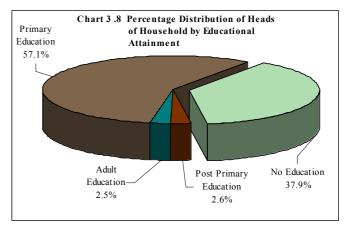

Information on educational status was collected from individual agricultural households. The results show that 37 percent of the population aged 5 years and above in agricultural households in the region had completed different levels of education and 28 percent were still attending school. Those who have never attended school were 35 percent (Chart 3.6).

Agricultural households in Mpwapwa district had the highest percentage of population aged 5 years and above who had completed different levels of education (41%). This was followed by Kongwa (39%), Dodoma Urban districts (38%), Dodoma Rural district (37%) and the last district is Kondoa with 35 percent (Chart 3.7).

The number of heads of agricultural households with formal education in Dodoma region was 193,009 (60%), those without any education were 122,648 (38%) and those with only adult education were 8,062 (2%). The majority of heads of agricultural households had primary level education (57.1%) whereas only 2.6 percent had post primary education (Chart 3.8).

With regard to the heads of agricultural households with primary education in Dodoma region, Mpwapwa district

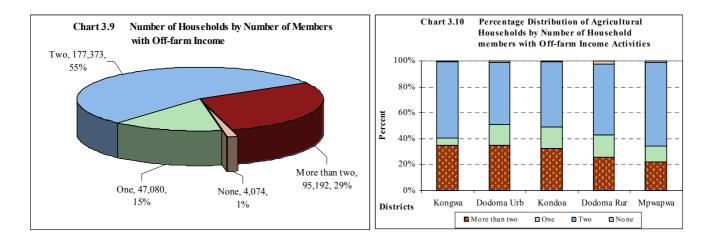

had the highest percentage (63.1%). This was followed by Kongwa (58.6%), Kondoa (56.2%), Dodoma Rural (55.8%) and Dodoma Urban (52.8%). There are very minor variations among the districts with regard to heads of agricultural households with secondary education (Mpwapwa had 1.9% and the rest of the districts 2.0%).

3.1.6 Off-farm Income

Off-farm income refers to cash generated from activities other than from the households holding. This can be either from permanent employment, temporary employment or labourers. It also includes cash generated from working on farms belonging to other farmers. Off-farm income is important amongst agriculture households in Dodoma with 98.7 percent of

households having at least one member with off-farm income. In Dodoma region 47,080 households (15%) had only one member aged 5 and above involved in off-farm income generating activity, 177,373 households (55%) had two members involved in off-farm income generating activities and 95,192 households (30%) had more than two members involved in off-farm income generating activities (Chart 3.9).

Kongwa and Kondoa districts had the highest percentage of agriculture households with off-farm income (over 99% of total agriculture households in each district). Other districts with a high percent of agriculture households with off-farm income were Mpwapwa (99.0%) and Dodoma Urban (98.7%). Dodoma Rural had the lowest percent of agriculture households

with off-farm income (97.6%). The district with the highest percent of agriculture households with more than one member with off-farm income was Kongwa (94.3%). Dodoma Rural district had the lowest percent of households with more than one member having off-farm income (82.1%).

3.2 Land Use

Land area and planted area are two different types of area measurements. Land area refers to the physical area of land and is the same regardless of the number of crops planted on the land in one year. Planted area is the total area of crops planted in a year and the area is summed if there were more than one crop on the same land per year. A number of terms are used in this section which requires defining for clarification as follows:

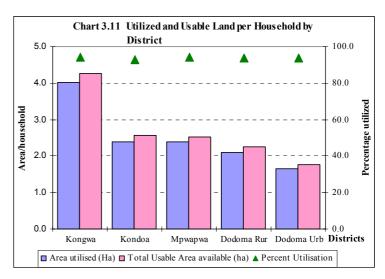

Land available refers to the area of land that has been allocated to smallholders through customary law, official title or other forms of ownership. Land available does NOT mean the total area of land that is designated as agriculture land in the country, however it is the land that is available to smallholders given the location of villages and lack of access to more remote parcels of unused agriculture designated land.

Usable land refers to the available land minus the land that cannot be used e.g. bare rock, shallow soils, steep slopes, swamp areas, etc. It does however include un-cleared bush. Utilised land refers to the land that was used during the year.

3.2.1 Area of Land Utilised

The total area of land available to smallholders in Dodoma Region was 855,264 ha which is 94 percent of the total land available to smallholders in the region. The regional average land area utilised for agriculture per household was only 2.4 ha. This figure is above the national average of 2.0 ha.

Large differences in land area utilised per household exist between districts in the region. In Kongwa the area utilised per household was 4.0 ha and in the rest of the districts it was between 1.6 ha (in Dodoma Urban) and 2.4 ha per household (in Kondoa and Mpwapwa). The smallest land area utilised per household is found in Dodoma Urban district (1.6 ha). The percent utilised of the usable land is high (around 94%). There is virtually no difference in the percentage of the usable land utilised per households between districts. The percentage utilized of the usable land per household is highest in Mpwapwa

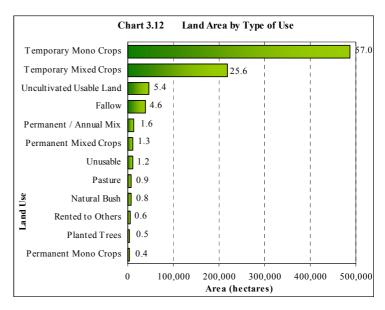

(94.4%) and lowest in Kondoa (92.8%). Ninety four percent of the total land available to smallholders was utilised. Only 6 percent of usable land available to smallholders was not used (Chart 3.11 and Map 3.7).

3.2.2 Types of Land Use

The area of land under temporary monocrops was 487,445 hectares (57.0% of the total land available to smallholders in Dodoma), followed by temporary mixed crops (218,871 ha, 25.6%), uncultivatable usable land (46,108 ha, 5.4%), area under fallow (39,437 ha, 4.6%), permanent/annual mix (13,491 ha, 1.6%), permanent mixed crop (11,460 ha, 1.3%), area unusable (10,443 ha, 1.2%), area under pasture (7,801 ha, 0.9%), Area under natural bush (6,902 ha, 0.8%), area rented to others (5,533 ha, 0.6%), area under planted trees (4,431 ha, 0.5%), and area under permanent monocrop (33,42 ha, 0.4%) (Chart 3.12).

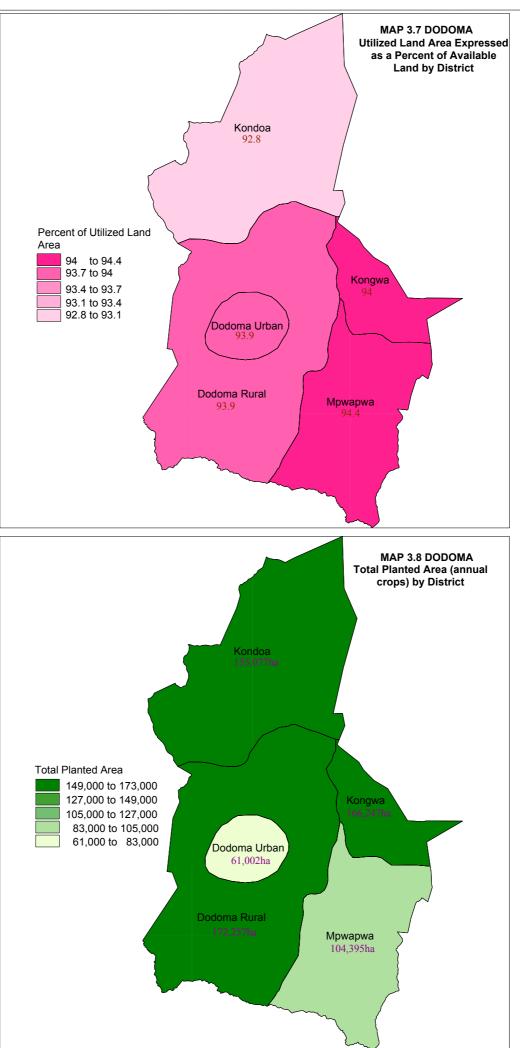

3.3 Annual Crop and Vegetable Production

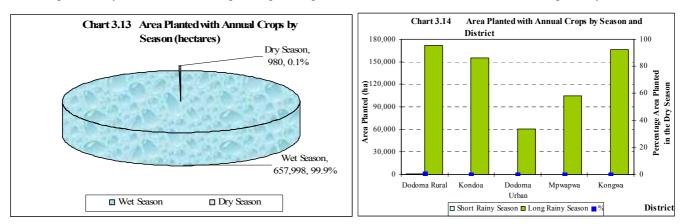

Dodoma region has a unimodal rainfall pattern starting in December and ending in March. With the exception of some irrigated annual crops and vegetables grown in the dry season, the rest of the crops are produced during the wet season. The quantity of crops produced in both seasons will be used as a basis for comparison with the past surveys and censuses.

3.3.1 Area Planted

The area planted with annual crops and vegetables in the region was 658,978 hectares, of which 980 hectares (0.15%) were planted during dry season and 657,998 hectares (99.85%) in the wet season (Charts 3.13 and 3.14). The average areas planted per household in the dry and wet season were 0.8 and 0.9 ha respectively. Note that the number of households growing crops in the dry season was very small and therefore district comparisons for planted area per household should be treated with caution and the same also applies to Chart 3.15.

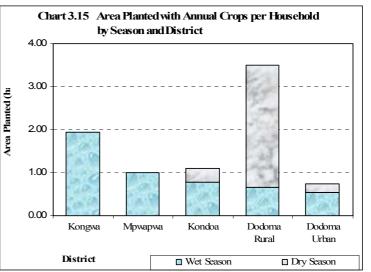

Tanzania Agriculture Sample Census

This is particularly in relation to the large area planted per household in Dodoma Rural district during the dry season.

Chart 3.15 shows that the district with the largest area planted per household is Dodoma Rural with over 3 hectares per household (the sum of the two seasons) this is followed by Kongwa (1.9 ha). The district with the smallest area planted per household was Dodoma Urban (0.8 ha).

In Dodoma Rural district the average area planted during the dry season is higher than that of the wet season the reverse is true in the rest of the districts (Chart 3.15 and Map 3.8).

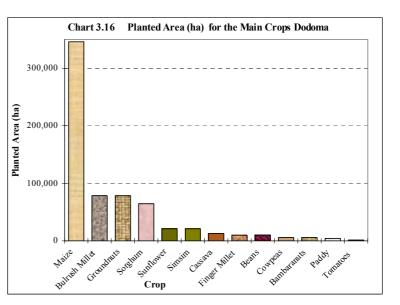

The average area planted per household during the wet season in Dodoma region was 0.9 hectares. Kongwa had the largest planted area per household in the wet season (1.9 ha) followed by Mpapwa and Kondoa (1.1 ha). The smallest planted area per household in the wet season is in Dodoma Urban (0.6ha). (Chart 3.15 and Map 3.9).

Analysis of the Most Important Crops

Results on crop production are presented in two different sections. The first section compares the importance of each crop regardless of whether they are annual or permanent. The second section contains a more detailed analysis on production based on crop types.

3.3.2 Crop Importance

Maize is the dominant annual crop grown in Dodoma region and it had a planted area 4.4 times greater than bulrush millet, which had the second largest planted area. The area planted with maize constitutes 52.5 percent of the total area planted with annual crops in the region.

Other annual crops of relative importance in the region (based on area planted) include groundnuts and sorghum. A small amount of sunflower, simsim, cassava, finger millet and beans are also grown in the region (Chart 3.16). Other annual crops are grown in minor quantities.

Chart 3.17a shows the area planted per household growing selected crops. Households that grow maize, finger millet, simsim, and bulrush millet have a larger planted area per household than for other crops

Vegetable crops have smaller planted area per household than cereals, roots and tubers and oilseed crops.

3.3.3 Crop Types

Cereals are the main crops grown in Dodoma region. The area planted with cereals was 502,753 ha (76.3% of the total planted area), followed by oils seeds with 120,211 ha (18.2%), pulses (20,554 ha, 3.1%), roots and tubers (13,419 ha, 2.0%) and fruit and vegetables (2,041 ha, 0.3%) (Chart 3.17b). No annual cash crop production was reported in the region.

The region has a single crop production season, in which almost all the crops are grown, with very little crops grown in the dry season. Due to the fact that the dry season production was very small, it is inappropriate to make detailed comparisons between the two seasons (Chart 3.18).

3.3.4 Cereal Crop Production

The total production of cereals in Dodoma

region was 201,942 tonnes. Maize was the dominant cereal crop with 149,492 tonnes (74.0% of total cereal crops produced), followed by bulrush millet (11.3%), sorghum (10.9%), finger millet (2.5%) and paddy (1.3%).

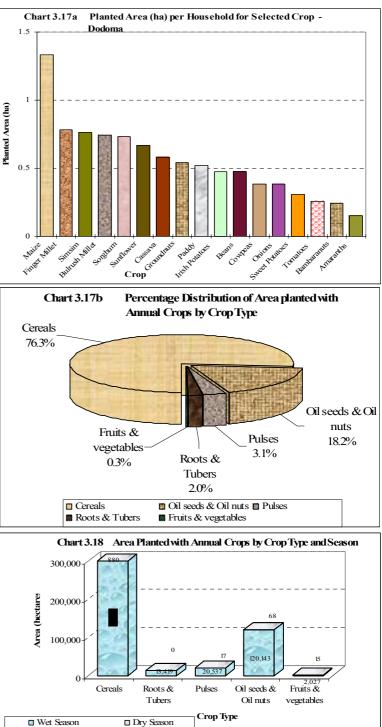

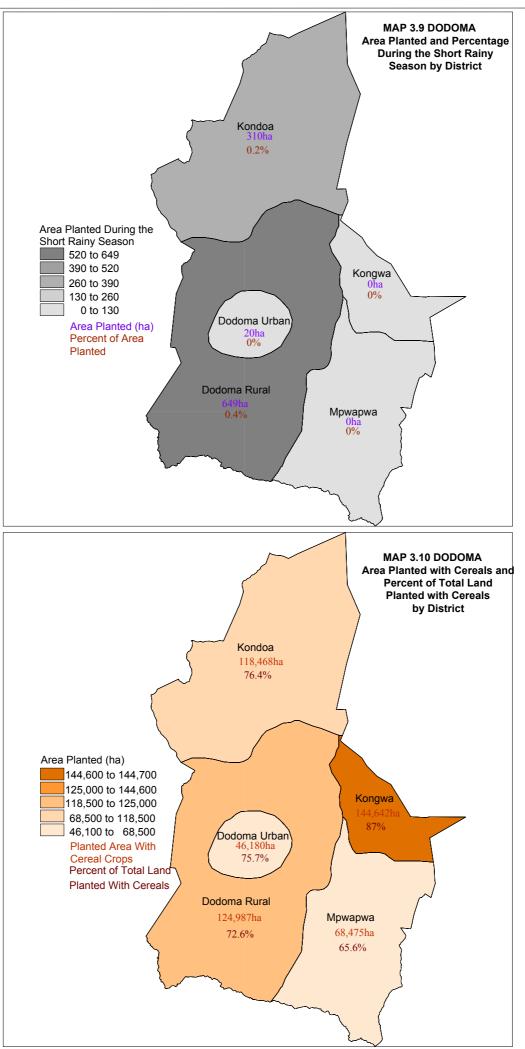

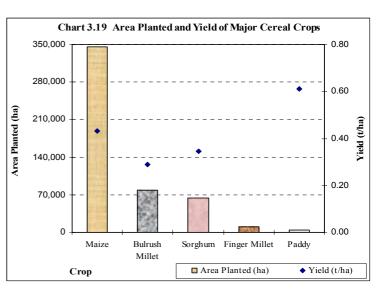

Table 3.2: Area, Production and Yield of Cereal Crops by Season

Crop		Dry Season		V	Net Seasor	ı	Total			
	Area	Quantity	Yield	Area	Quantity	Yield	Area	Quantity	Yield

Bulrush Millet	59	14	247	78,496	22,711	289	78,555	22,726	289	
Finger Millet	0	0	0	10,153	5,106	503	10,153	5,106	503	
Total	880	1,678	X	501,873	200,264	X	502,753	201,942	\times	

Kongwa had the largest planted area of cereals in the region (144,642 ha) followed by Dodoma Rural district (124,987 ha), Kondoa (118,468 ha), Mpwapwa (68,475 ha) and Dodoma Urban district (46,180 ha) (Map 3.10).

The total area planted with cereals during the wet and dry seasons was 502,753 ha, of which 501,873 ha (99.8%) was planted during the wet season and 880 ha (0.2%) was planted in dry season. The wet season accounts for 99.2 percent of the total cereals produced in both seasons. The planted area with maize was dominant and it represented 68.8 percent of the total area planted with cereal crops, then followed by bulrush millet (15.6%), sorghum (12.7%), finger millet (2.0%) and paddy (0.8%) (Table 3.2).

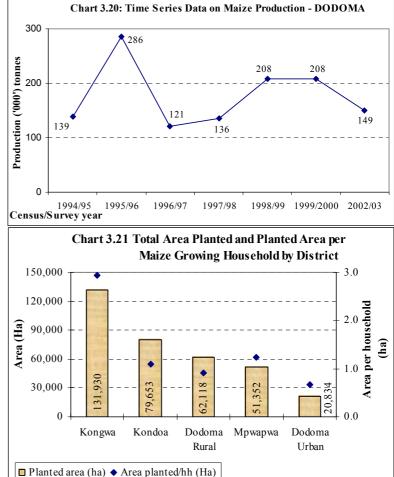

The yield of paddy was 612 kg/ha, followed by finger millet (503 kg/ha), maize (432 kg/ha), sorghum (345 kg/ha) and bulrush millet (280 kg/ha) (Chart 3.19).

3.3.4.1 Maize

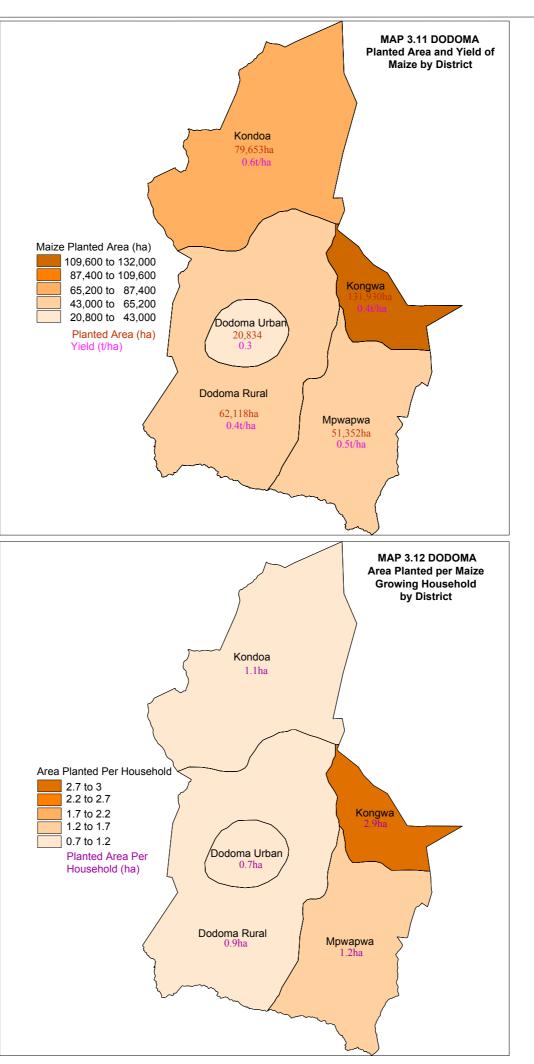

Maize dominates the production of cereal crops in the region. The number of households growing maize in Dodoma region during the wet season was 258,629 (80% of the total crop growing households in the region during the wet season). The total production of maize was 149,492 tonnes from a planted area of 345,887 hectares resulting in a yield of 0.4 t/ha.

Chart 3.20 presents the maize production trend (in thousand metric tonnes). There was a sharp increase in maize production over the period 1995 to 1996 (106%), after which the production dropped by 58 percent over the period 1996 to 97. Production gradually increased over the period 1997 to 1999 and thereafter declined over the period 2000 to 2003 (Chart 3.20).

The average area planted with maize per

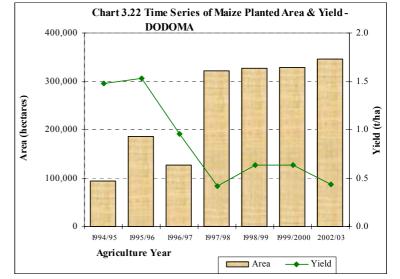

household was 1.3 hectares, however it ranged from 0.7 hectares in Dodoma Urban district to 2.9 hectares in Kongwa district (Map 3.11). Kongwa had the largest planted area of maize (131,930 ha) followed by Kondoa (79,653 ha), Dodoma Rural (62,118 ha), Mpwapwa (51,352 ha) and Dodoma Urban (20,834 ha) (Chart 3.21 and Map 3.12).

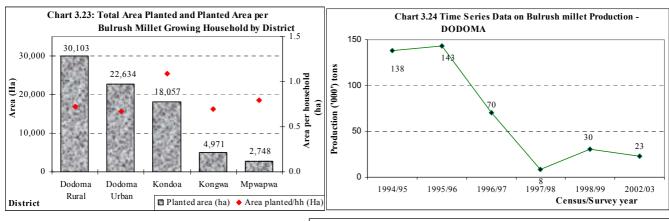

The planted area of maize increased sharply between 1997 and 1998 and has remained almost constant since then. Conversely, the yield declined sharply between 1996 and 1998 and has remained at this low level since then.

Whilst Chart 3.20 shows that, there has been a slight increase in the production of maize over the last 10 years, this has been due to the large increase in the planted area and not due to increased productivity (Chart 3.22).

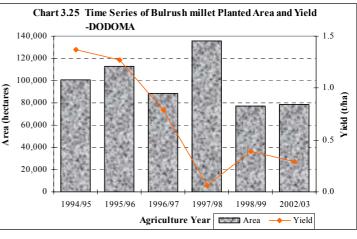

3.3.4.2 Bulrush Millet

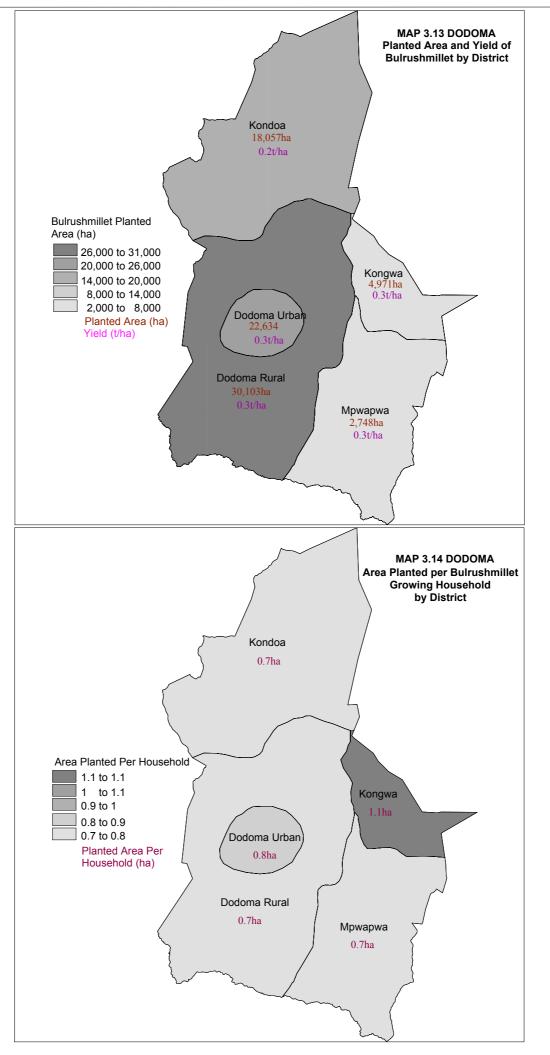

Bulrush millet is the second most important cereal crop in the region in terms of planted area. The number of households that grew bulrush millet in Dodoma region during the wet season was 105,464, representing 33 percent of the total crop growing households. The total production of bulrush millet was 22,711 tonnes from a planted area of 78,496 hectares resulting in a yield of 0.29 t/ha. The district with the largest planted area with bulrush millet was Dodoma Rural (30,103 ha) followed by Dodoma Urban (22,634 ha), Kondoa (18,057 ha), Kongwa (4,971 ha) and Mpwapwa (2,748 ha) (Map 3.13). There are variations in the average area planted per crop growing household among the districts ranging from 0.67 ha in Dodoma Urban to 1.09 ha in Kondoa (Chart 3.23 and Map 3.14).

There was a dramatic drop in the production of bulrush millet from 143,000 tonnes in 1995/96 to 8,000 in 1997/98 after which the production rose from 8,000 tons in 1997/98 to 30,000 tonnes in 1998/99. The production dropped from 30,000 tonnes in 1998/99 to 23,000 in 2002/03. Charts 3.23 show that the area planted with bulrush millet has declined at a small rate over the ten years period from 1994/95 to 2002/03. The dramatic reduction in the quantity of bulrush millet production over this period has been

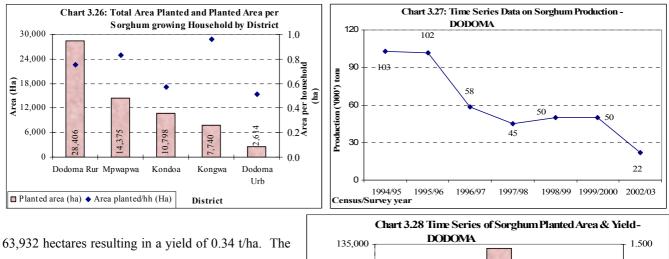

primarily due to a reduction in productivity and not due to a reduction in the planted area (Charts 3.24 and 3.25).

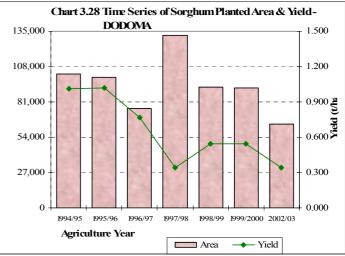

3.3.4.3 Sorghum

Sorghum is the third most important cereal crop in the region in terms of planted area. The number of households that grew sorghum in Dodoma region during the wet season was 87,136. This represents 23 percent of the total crop growing households in Dodoma region in the wet season. The total production of sorghum was 22,032 tonnes from a planted area of

Area (hectare

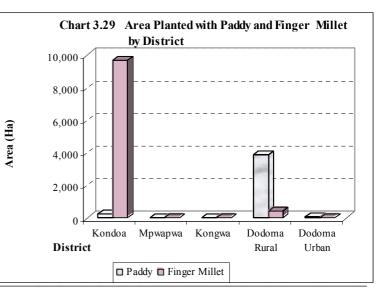

district with the largest planted area of sorghum was Dodoma Rural (28,406 ha) followed by Mpwapwa (14,375 ha), Kondoa (10,798 ha), Kongwa (7,740 ha) and Dodoma Urban (2,614 ha) (Map 3.15). Agricultural households in Kongwa district had the largest average area planted per household (0.96 ha) followed by Mpwapwa (0.83 ha), Dodoma Rural (0.75 ha), Kondoa (0.57 ha) and Dodoma Urban (0.52 ha) (Chart 3.26 and Map 3.16).

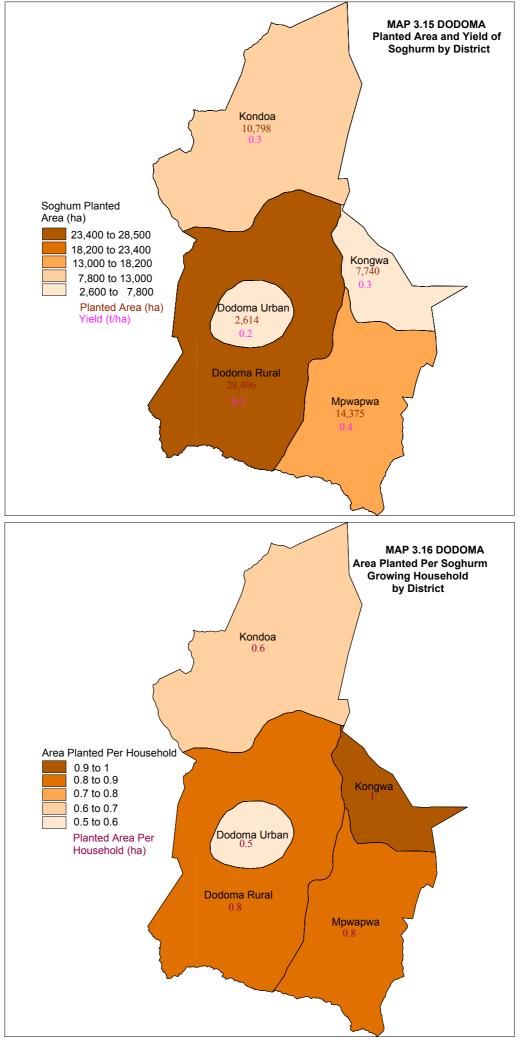

There was a large reduction in the production of sorghum from 102,000 tonnes in 1995/96 to 45,000 tonnes in 1997/98 (Chart 3.27). During the period 1998 to 2000, the production remained constant at around 50,000 tonnes. Chart 3.28 shows that there has been a gradual reduction in the area planted with sorghum, however it is mainly the reduction in productivity that has caused the reduction in production. This implies that the dramatic reduction in the quantity of sorghum production over the reported period was a factor of both a reduction in area planted as well as declining yields.

3.3.4.4 Other Cereals

Other cereals that are produced in small quantities are paddy and finger millet. The district with the largest area planted with paddy is Dodoma Rural (3,906 ha) with other districts having small planted areas. The largest area planted with finger millet was in Kondoa district (9,661 ha). Other districts had insignificant planted areas of finger millet (Chart 3.29).

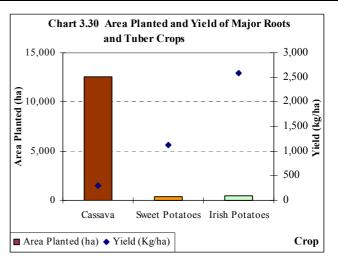

Tanzania Agriculture Sample Census

3.3.5 **Roots and Tuber Crops Production**

The total production of roots and tubers was 5,544 tonnes. Cassava production was higher than any other root and tuber crop in the region with a total production of 3,896 tonnes representing 70.3 percent of the total root and tuber crop production. This was followed by Irish potatoes with 1,268 tonnes (22.9%) and sweet potatoes (380 tonnes, 6.8%) (Chart 3.30 and Table 3.3).

The area planted with cassava was larger than any other root

Irish Potatoes	0	0	0	491	1,268	2,584	491	1,268	2,584	
Total	0	0	Х	13,419	5,544	\times	13,419	5,544	\times	

tote: Cassava is produced in both the long and Dry Season. However, it was not possible to separate assava production in the different growing seasons as the growth period spans both seasons and even over a year in certain varieties. Because of this, cassava has been combined and is reported in the Wet Season only.

The yield Irish potatoes was (2.6 t/ha), sweet potatoes (1.1 t/ha) and cassava (0.3 t/ha).

3.3.5.1 Cassava

The number of households growing cassava in the region was 21,630. This represents 6.7 percent of the total crop growing households in the region. The total production of cassava during the census year was 3,896 tonnes from a planted area of 12,953 hectares resulting in a yield of 0.3t/ha.

Previous censuses and surveys indicate that the area planted with cassava increased gradually over the period 1995/96 to 1998/99 (Chart 3.31). The area planted with cassava accounted for 1.9 percent of the total area planted with annual crops and vegetables in the census year.

Mpwapwa district had the largest planted area of cassava (4,618 ha, 37% of the cassava planted area in the region), followed by Dodoma Rural (3,316 ha, 26%), Kondoa (2,893 ha, 23.0%), Dodoma Urban (999 ha, 8%) and Kongwa (767 ha, 6%) (Map 3.17). However, the highest proportion of land planted with cassava, expressed as a percent of the total planted area was in Mpwapwa district (4.4%). This was followed by Dodoma Rural (1.9%), Kondoa (1.9%) Dodoma Urban (1.6%) and Kongwa (0.5%) (Chart 3.32).

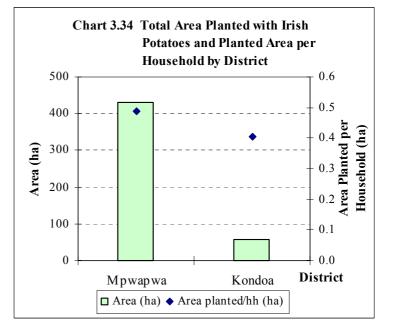

The average cassava planted area per cassava growing households was 0.58 hectares. However, with the exception of Mpwapwa, there were small district variations in average area planted with cassava per household among the rest of the districts. The area planted per cassava growing household was greatest in Mpwapwa (3.40 ha), followed by Kongwa (0.66 ha), Kondoa (0.43 ha), Dodoma Rural (0.35 ha) and Dodoma Urban (0.34 ha) (Chart 3.33 and Map 3.18).

3.3.4.5 Irish Potatoes

The number of households growing Irish potatoes in Dodoma region was 1,031. This was 4.3 percent of the total root and tuber crop growing households during the wet season. The total production of Irish potatoes during the census year was 1,268 tonnes from a planted area of 491 hectares resulting in a yield of 2.6t/ha.

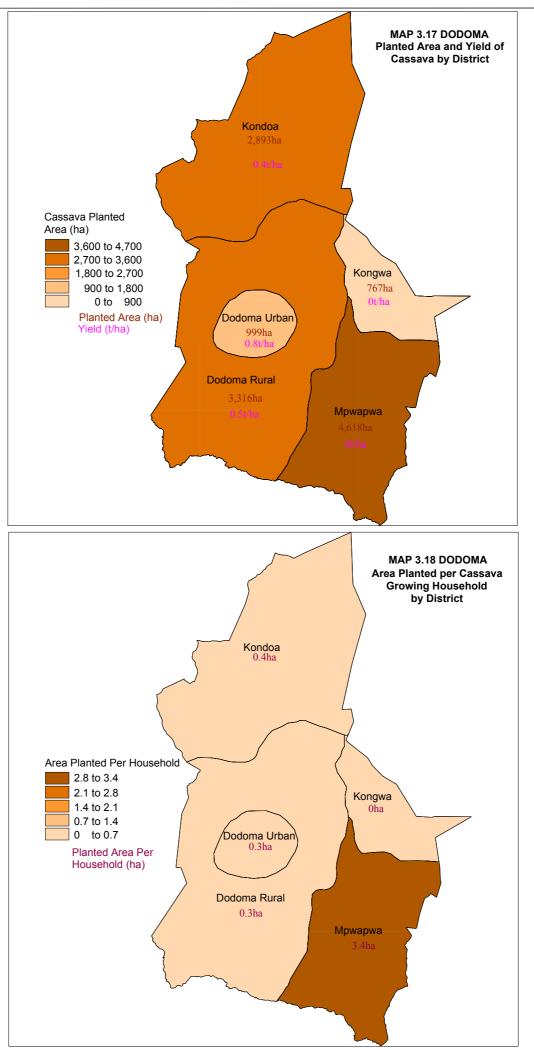

Irish potato production was found in Mpwapwa and Kondoa districts only in which the largest planted area was in Mpwapwa (432 ha, 88.1%), followed by Kondoa (43 ha, 11.9%) (Chart 3.34). Sweet potatoes were produced in very small amounts.

3.3.5 Pulse Crops Production

The total area planted with pulses was 20,554 hectares, of which 9,620 ha were planted with beans (46.8% of the total area planted with pulses), followed by cow peas (5,737 ha, 27.9%), Bambaranuts (4,956 ha, 24.1%), green gram (96 ha, 0.5%), chick peas (88 ha, 0.4%) and mung beans (57 ha, 0.3%). The only pulse crop planted during the dry season was green grams with a planted area of 17 ha, representing 0.1 percent of total area planted with pulses during the year.

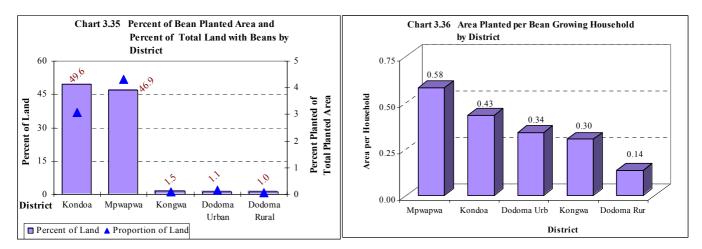

The total production of pulses was 5,350 tonnes. Beans had the highest producing pulse crop (2,665 tonnes) and accounted for 49.8 percent of the total pulse production. This was followed by cow peas (1,362t, 25.5%), bambara nuts (1,303t, 24.4%)

and green gram (19t, 0.4%). Although Mung beans and chick peas were planted, there were no harvests for these crops due to lack of rainfall. Beans had the highest yield of 277 kgs/ha followed by Bambara nuts (263 kgs/ha), cowpeas (237 kgs/ha) and Green gram (197 kgs/ha) (Table 3.4).

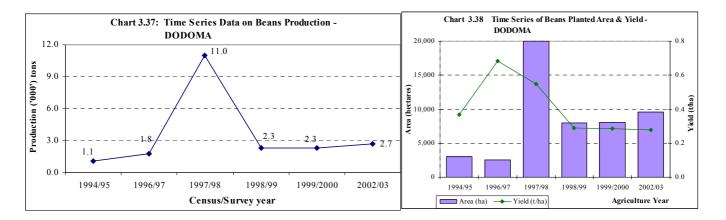

Table 3.4: Area, Production and Yield of Pulses by Season

Total	17	3	Х	20,537	5,347	Х	20,554	5,350	Х	

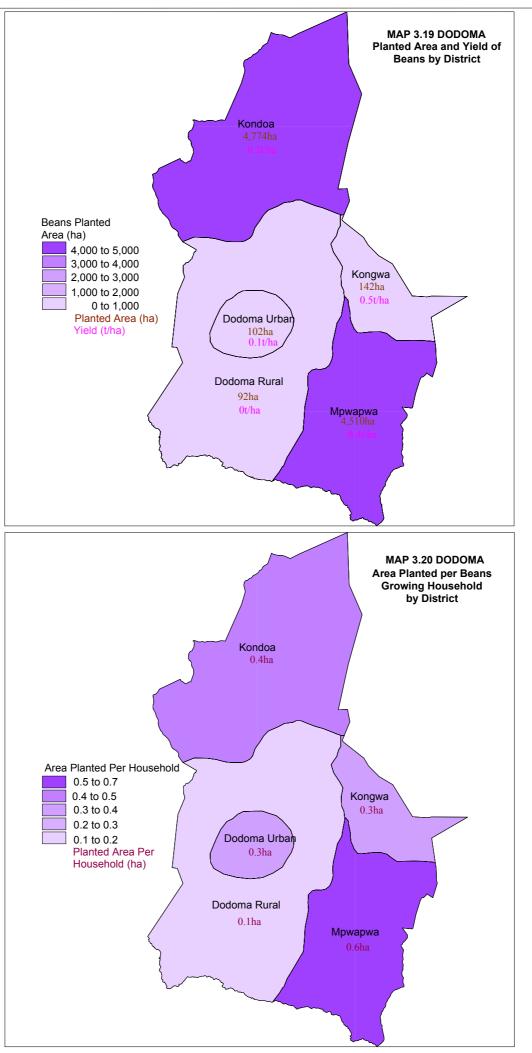

3.3.5.1 Beans

Beans dominate the production of pulse crops in the region. The number of households growing beans in Dodoma region was 20,250. The total production of beans in the region was 2,665 tonnes from a planted area of 9,620 hectares resulting in yield of 0.3 t/ha. The largest area planted with beans in the region was in Kondoa district with 4,774 ha (49.6% of the total area planted with beans in the region) (Chart 3.35 and Map 3.19). The average area planted per household in the region was 0.5 ha, however there are great variations on area planted with beans per household among the districts ranging from 0.58 ha in Mpwapwa district to 0.14 ha in Dodoma Rural district (Chart 3.36 and Map 3.20).

Dodoma region experienced bumper harvest of beans during 1998 in which the production increased by 1000 percent compared to that of 1997. The production dropped from 11,000 tonnes in 1998 to 2300 tonnes in 1999. Since then, beans production has remained more or less constant (Chart 3.37).

33

The area planted with beans increased sharply over the period from 1997 to 1998 and dropped for the period 1998 to 1999. The area remained fairly constant over the period from 1999 to 2003. Charts 3.37 and 3.38 show that the annual levels of production closely follow the annual planted area and are thus the main factor causing changes in the annual production. However, the reduction in productivity between 1997 and 1999 has also had an impact on the production levels over the period 1999 to 2003.

3.3.6 **Oil Seed Production**

The total production of oilseed crops was 43,948 tonnes, planted on an area of 120,211 hectares. The total planted area of oilseeds in the wet season was 120,143 ha representing 99.9 percent of the total area planted with oil seeds (Table 3.5).

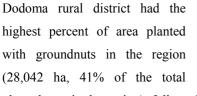

Groundnuts were the most important oilseed crop with 78,311 ha (65.1% of the total area planted with oil seeds), followed by sunflower (17.5%), simsim (17.2%) and soya beans (0.1%). The yield of groundnuts was the highest of all oil seed crops (386 kg/ha) followed by sim sim (344 kg/ha) and sunflower (312 kg/ha). The total production of groundnuts was 30,245 tonnes, accounting for 68.8 percent of the total production of oil seeds, followed by simsim (16.2%) and sunflower (15.0%) (Chart 3.39).

3.3.6.1 Groundnuts

The number of households growing groundnuts in Dodoma region was only 144,458. The total production of groundnuts in the region was 30,245 tonnes from a planted area of 78,311 hectares resulting in a yield of 0.4 t/ha.

There has been a large increase in production of groundnuts from 17,087 tonnes in 1995 to 70,556 tonnes in 1997, however the production dropped to 30,245 tonnes in 2003 (Chart

3.40).

Sunflower 34 494 21,040 6,565 312 21,074 6,582 312 10 Simsim 0 20,709 7 1 2 1 20 709 7 1 2 1 ((344 344 Groundnuts 34 18 535 78,277 30.227 386 78.311 30,245 386 Soya Bean 0 (116 116 68 35 120,143 43,913 120,211 43,948 Total planted area in the region), followed by Mpwapwa (22,540 ha, 29.4%), Kongwa (16,091 ha, 16.8%), Dodoma Urban (8,513

ha, 9.6%) and Kondoa (3,125 ha, 3.0%) (Map 3.21). However, the highest proportion of land with groundnuts was found in Mpwapwa followed by Dodoma Rural, Dodoma Urban, Kongwa and Kondoa districts (Chart 3.41 and Map 3.22).

Tanzania Agriculture Sample Census

The largest area planted per groundnut growing household was found in Mpwapwa district (0.88 ha) and the lowest was in Dodoma Urban (0.34). Other district and their respective area planted per groundnuts growing households are Kongwa (0.79 ha), Dodoma Rural (0.43 ha) and Kondoa (0.41 ha) Chart 3.42).

3.3.7 Fruit and Vegetables

The collection of fruit and vegetable production data was difficult due to the small quantities produced per household. Most of the data presented here gives the production of smallholders who grew these crops as cash crops and not for household consumption. Most fruit production is from permanent crops. The dry season is not important for fruit and vegetables production since only 0.5 percent of the total area planted with fruit and vegetables was produced during the dry season. However, over 60 percent of the planted area of tomatoes, water melon, ginger, spinach and radish was planted during the dry season. With the exception of cabbages, which was produced in both seasons, the rest of the vegetables were produced in the wet season. Reliable historical data for time series analysis of fruit and vegetables was not available.

The total production of fruit and vegetables was 3,419 tonnes. The most cultivated fruit and vegetable crop was tomatoes with a production of 1,982 tonnes (58% of the total fruit and vegetables produced) followed by onions (511t, 15%) and amaranths (352t, 10%). The production of the other fruit and vegetables crops was relatively small (Table 3.6).

Table 3.6: Area, Production and Yield of Fruit and vegetables by Season

Total	15	9	\geq	2,027	3,410	\succ	2,041	3,419	\times	

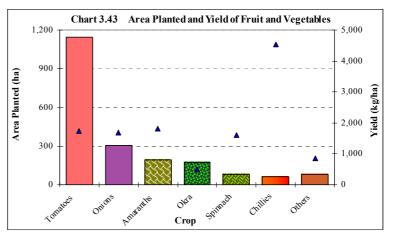

Chillies had the highest yield (4,530 kg/ha) followed by carrots (3,754 kg/ha), amaranths 1,823kg/ha, and tomatoes (1,735 kg/ha). Tumeric and radish had the lowest yields of 395 and 296 kg/ha respectively (Table 3.6).

3.3.7.1 Tomatoes

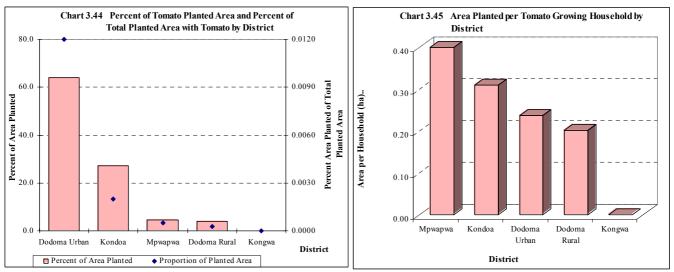

The number of households growing tomatoes in the region was 4,458 which represent 0.6 percent of the total crop growing households in the region during the wet season. Tomatoes were grown during the wet season only.

Dodoma Urban district had the largest planted area of tomatoes (64.1% of the total area planted with tomatoes in the region), followed by Kondoa (27.3%), Mpwapwa (4.6%) and Dodoma Rural (4.0%) (Chart 3.43 and Map 3.23).

With the exception of Kongwa district which did not grow tomatoes, the rest of the districts have relatively low percentage of land used for tomato production (Chart 3.43)

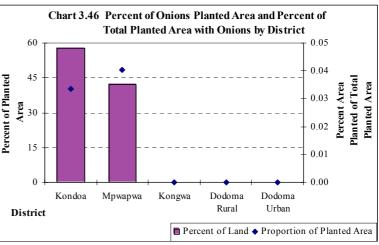

The largest area planted per tomato growing household was found in Mpwapwa district (0.4 ha) followed by Kondoa (0.31 ha), Dodoma Urban (0.24 ha) and Dodoma Rural (0.20 ha) (Chart 3.45 and Map 3.24). The total area planted with tomatoes accounted for 0.2 percent of the total area planted with annual crops and vegetables.

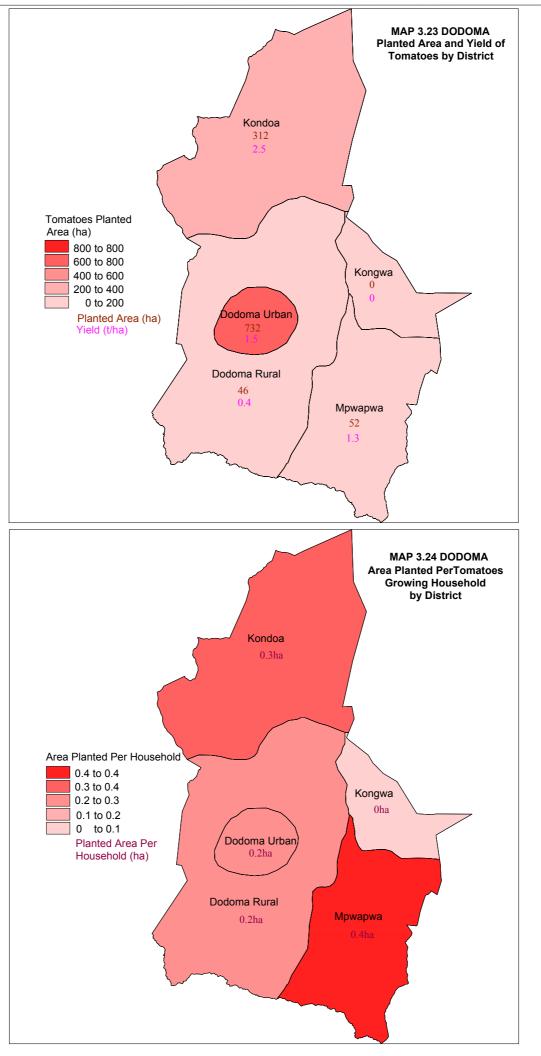

3.3.8.2 Onions

The number of households growing onions in the region was 2,277. This represents 0.1 percent of the total crop growing households in the region during the wet season. The crop was grown during the wet season only.

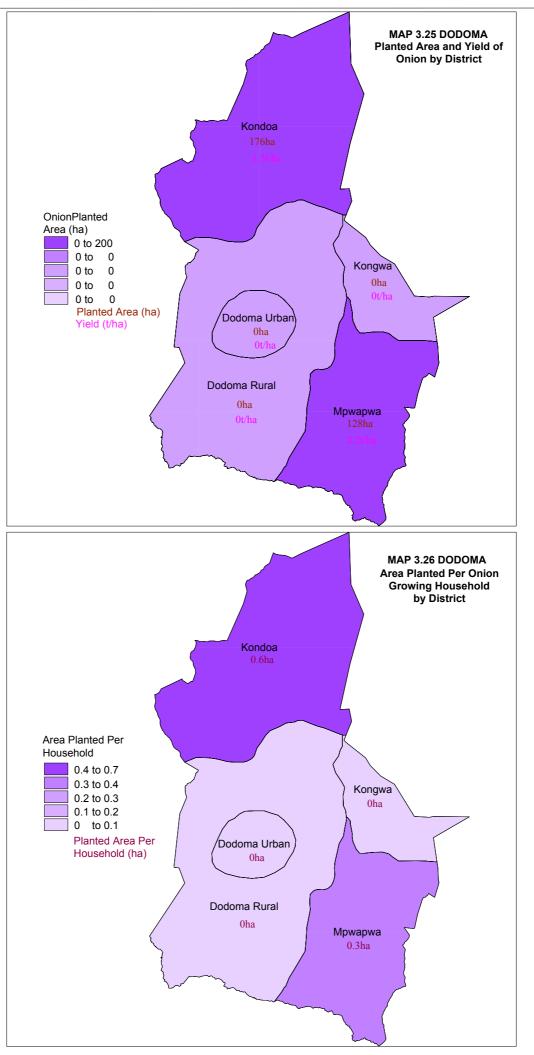

Kondoa district had the largest planted area of onion (176 ha, 57.8% of the total area planted with onion in the region), followed by Mpwapwa

(Map 3.25). The crop was grown in these two districts only (Chart 3.46). The total area planted with onions accounted for 0.05 percent of the total area planted with annual crops and vegetables during the wet seasons.

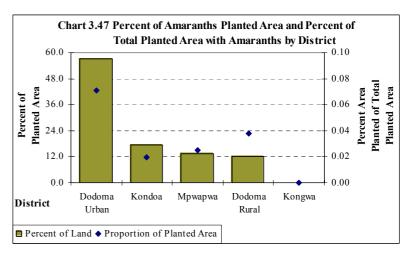

Tanzania Agriculture Sample Census

3.3.8.3 Amaranths

The number of households growing amaranths in the region was 1,294 households. This represents 0.17 percent of the total crop growing households in the region in the wet season. The crop was grown during the wet season only. Dodoma Urban district had the largest planted area of amaranths (110 ha, 57.1% of the total area planted with amaranths in the region), followed by Kondoa (33 ha, 17.3%), Mpwapwa (26 ha, 13.6%) and Dodoma Rural (23ha, 12%). Amaranths are not produced in Kongwa district (Map 3.27 and 3.28).

The largest proportion of the area planted with amaranths was found in Dodoma Urban district (0.07%), followed by Dodoma Rural (0.04%), Mpwapwa (0.03%) and Kondoa (0.02) (Chart 3.47).

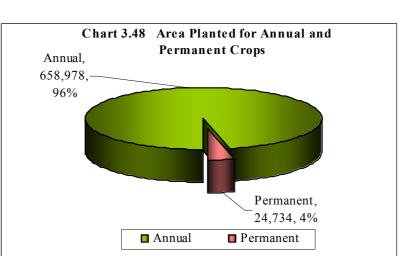

The total area planted with amaranths accounted for 0.03 percent of the total area planted with annual crops and vegetables during the wet season.

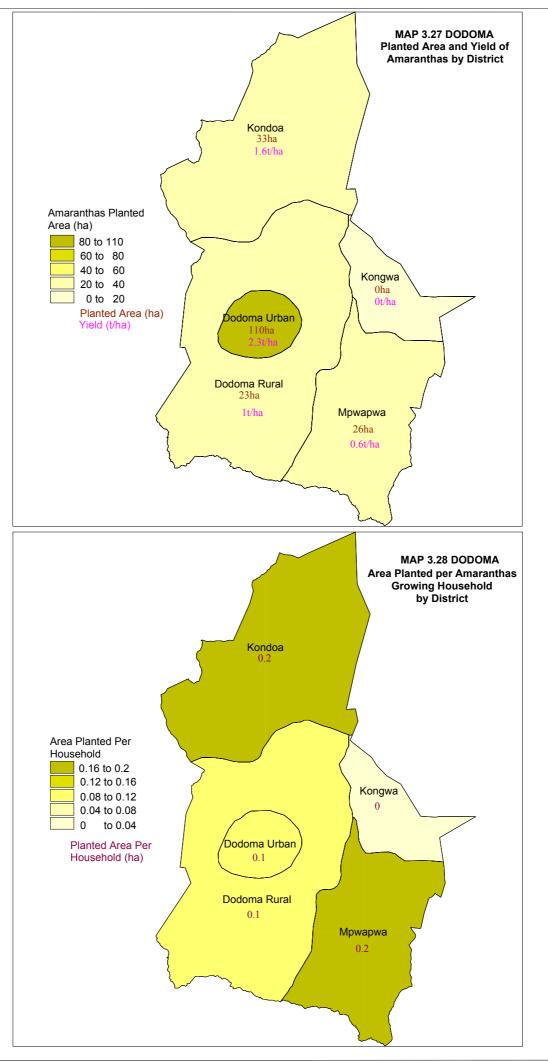

3.4 Permanent Crops

Permanent crops (sometimes referred as perennial crops) are crops that normally take over a year to mature and once mature can be harvested for a number of years. For most crops, it is easy to determine if they are annual or permanent. However, for crops like cassava and bananas the distinction is not so clear. Cassava has varieties that mature within a year and produces only one harvest, whilst other varieties survive for more than one year and produces several harvests. In this census, cassava was treated as an annual crop. Conversely, bananas normally take less than a year to mature, survive for more than one year and are thus treated as a permanent crop. In this report, the agriculture census results are presented for the most important permanent crops in terms of production, yield and area planted. Previous censuses and surveys did not measure these variables for permanent crops, therefore time series analysis cannot be made in this section.

The planted area of smallholders with permanent crops was 24,734 hectares (4% of the area planted with annual and

permanent crops in the region). However, the area planted with annual crops is not the actual physical land area as it includes the area planted more than once on the same land, whilst for the planted area for permanent crops is the same as the physical planted land area. So the percentage physical area planted with permanent crops would be higher than indicated in Chart 3.48.

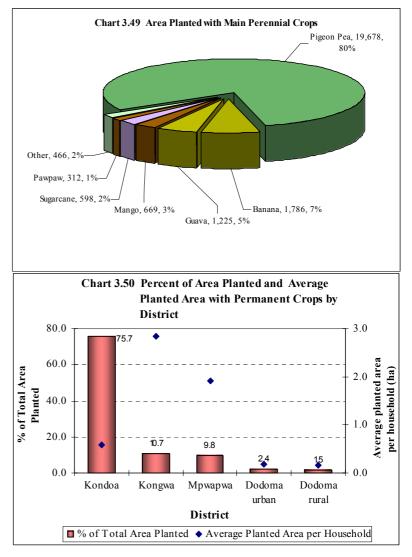

The most important permanent crop in Dodoma region is pigeon peas which accounts for a planted area of 19,678 ha, (80% of the planted area of all permanent crops) followed by banana (1,786 ha, 7%), guava (1,225 ha, 5%), mango (669 ha, 3%), sugarcane (598 ha, 2%), pawpaw (312 ha, 1%) and grape (278 ha, 1%). Each of the remaining permanent crops had an area of less than 1 percent of the total area planted with permanent crops (Chart 3.49).

Kondoa district had the largest area under smallholder permanent crops (18,719 ha, 75.7%). This is followed by Kongwa (2,615 ha, 10.7%), Mpwapwa (2,415 ha, 9.8%), Dodoma Urban (584 ha, 2.4%) and Dodoma Rural (368 ha, 1.5%). However, Kongwa had the largest area per permanent crop growing household (2.85 ha) followed by Mpwapwa (1.90 ha), Kondoa (0.58 ha), Dodoma Urban (0.17 ha) and Dodoma Rural (0.16 ha) (Chart 3.50).

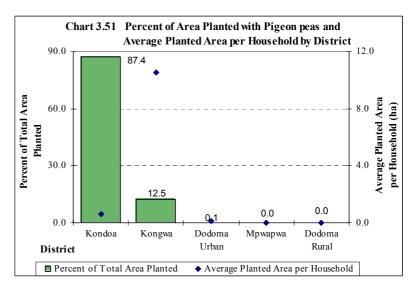

In terms of area of permanent crops planted expressed as a percentage of the total area

planted with crops per district, Kondoa had the highest (10.8%) followed by Mpwapwa (2.3%), Kongwa (1.6%), Dodoma Urban (0.9%) and Dodoma Rural (0.2%).

3.4.1 Pigeon Peas

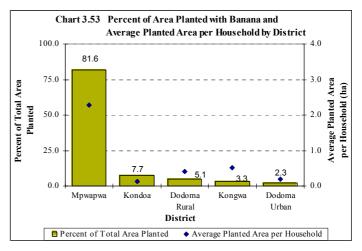

The total production of pigeon peas by smallholders was 5,140 tonnes. In terms of area planted pigeon pea, with a planted area of 19,678 ha, was the most important permanent crop grown by smallholders in the region. They were grown by 26,588 households (8.2% of the total crop growing households). The average area planted with pigeon peas per household was relatively small at around 0.7 ha per pigeon pea growing household and the average yield obtained by smallholders was 343 kg/ha from a harvest area of 14,799 hectares.

Kondoa had the largest area of pigeon peas in the region (17,199 ha, 87.4%) followed by Kongwa (2,468 ha, 12.5%), and Dodoma Urban (10 ha, 0.1%). However, the average area planted with pigeon peas per pigeon pea growing household was highest in Kongwa (10.5 ha) followed by Kondoa (0.6 ha) and Dodoma Urban (0.1 ha). There was no pigeon pea production in Mpwapwa and Dodoma Rural districts (Chart 3.51 and Maps 3.29 and 3.30).

3.4.2 Banana

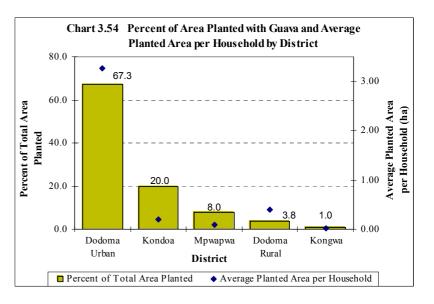

The total production of banana by smallholders was 1,087 tonnes. In terms of area planted, banana with a planted area of 1,786 ha was the second most important permanent crop grown by smallholders in the region. It was grown by 2,189 households (0.7% of the total crop growing households). The average area planted with banana per household was relatively small at around 0.8 ha per banana growing household and the average yield obtained by smallholders was 5,160 kg/ha from a harvested area of 211 hectares.

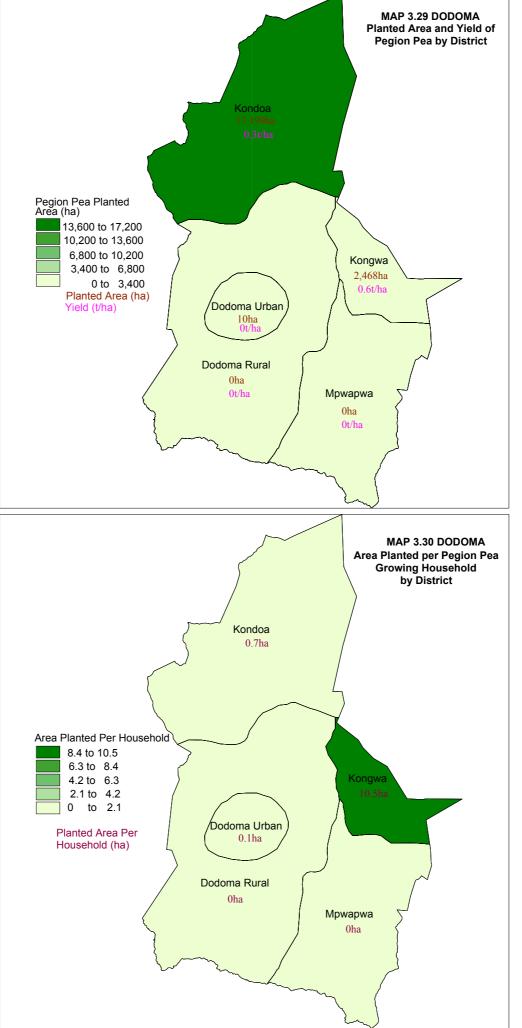

Mpwapwa had the largest planted area of banana in the region (1,458 ha, 81.6%) followed by Kondoa (138 ha, 7.7%) (Map 3.31). The area planted with banana per banana growing household was highest in Mpwapwa (2.3 ha) followed by Kongwa (0.5 ha). Kondoa had the least area planted with banana per household (Chart 3.52 and Map 3.32).

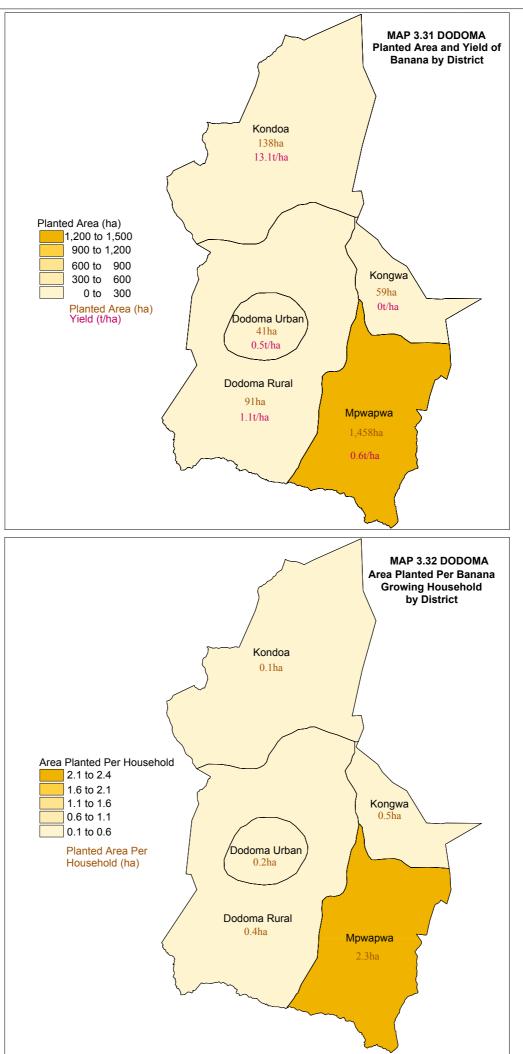

3.4.3 Guava

The total production of guava by smallholders was 939 tonnes. In terms of area planted, guava, with a planted area of 1,225 ha was the third most important permanent crop grown by smallholders in the region. It was grown by 2,761 households (0.85% of the total crop growing households). The average area planted with guava per household was relatively small at around 0.44 ha per guava growing household and the average yield obtained by smallholders was 3,221 kg /ha from a harvest area of 291 hectares.

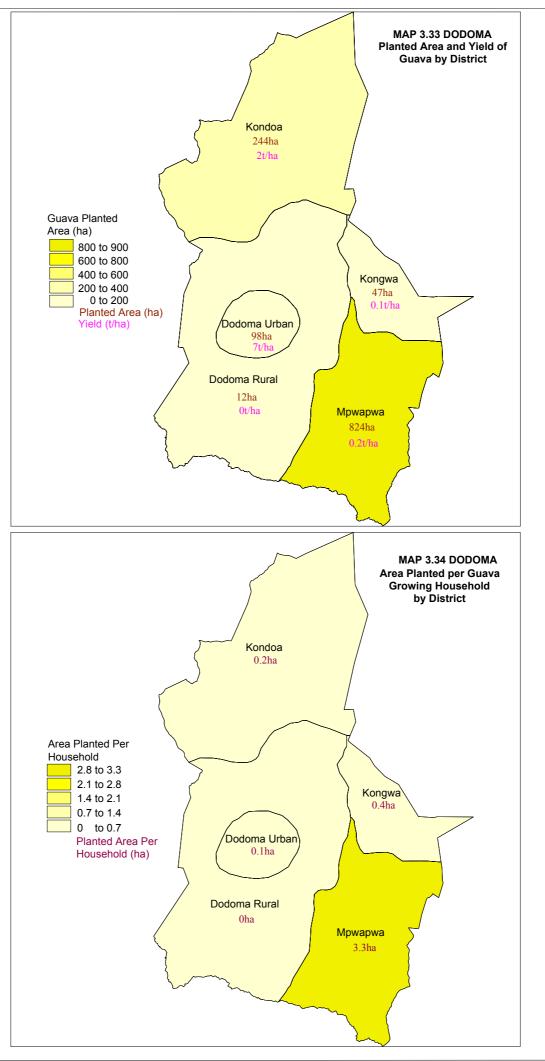

Dodoma Urban has the largest planted area of guava in the region (824 ha, 67.3%) followed by Kondoa (244 ha, 20%), Mpwapwa (98 ha, 8.0%), Dodoma Rural (47 ha, 3.8%) and Kongwa (12 ha, 1.0%) (Map 3.33). The average area planted per guava growing household was highest in Dodoma Urban (3.26 ha), followed by Dodoma Rural (0.40 ha), Kondoa (0.19 ha), Mpwapwa (0.09 ha) and Kongwa (0.03 ha) (Chart 3.53 and Map 3.34).

Tanzania Agriculture Sample Census

3.4.4 Mango

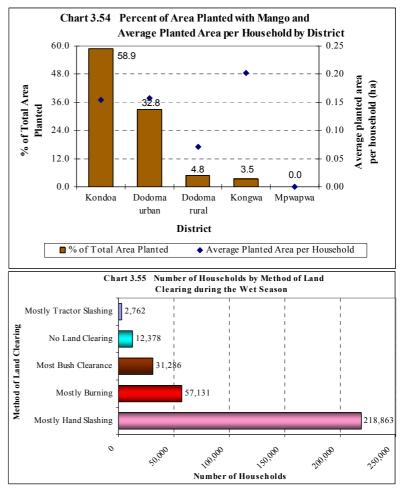

The total production of mango by smallholders was 1,569 tonnes. In terms of area planted, mango was the fourth most important permanent crop grown by smallholders in the region. It was grown by 3,187 households (1.0% of the total crop growing households). The average area planted with mango trees per household was relatively small at around 0.21 ha per mango growing household and the average yield obtained by smallholders was 2,482 kg/ha from a harvest area of 632 hectares.

Kondoa had the largest area of mango in the region (394 ha, 58.9%) followed by Dodoma Urban (220 ha, 32.8%), Dodoma Rural (32 ha, 4.8%) and Kongwa (23ha, 3.5%) (Map 3.35). However, the average area planted with mangoes per mango planting household was highest in Kongwa (0.20ha) followed by Dodoma Urban (0.16 ha), Kondoa (0.15 ha) and Dodoma Rural (0.07 ha) (Chart 3.53). There was no mango production in Mpwapwa district (Chart 3.54 and Map 36).

3.5 Inputs/Implements Use

3.5.1 Methods of Land Clearing

Land clearing is a common pre-tillage operation practiced by most farmers in the region. Land clearing is divided into two categories; bush clearing, which by definition implies either expansion into virgin areas or into areas which have been left fallow for a long period. The other

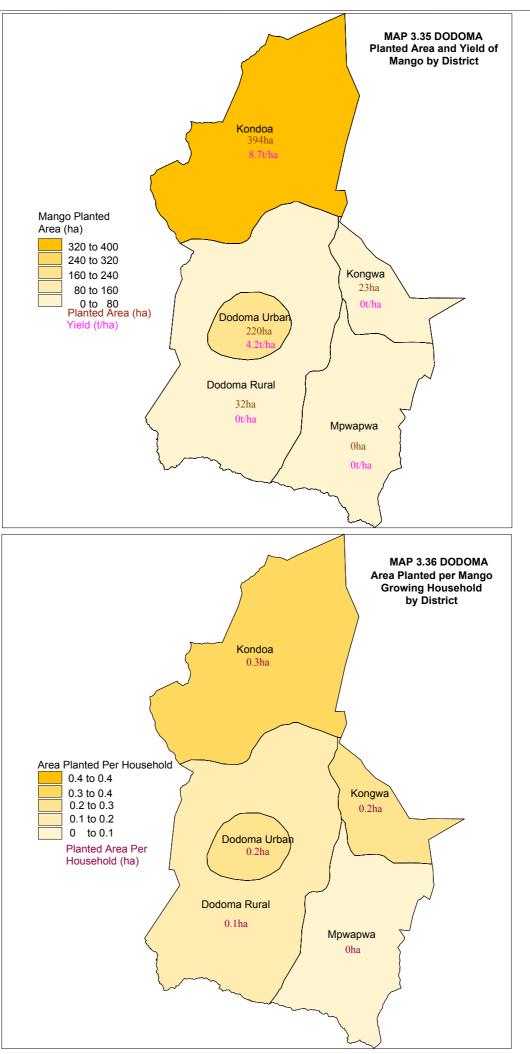

category, which includes burning, hand slashing or tractor slashing, is normally an annual clearing exercise to remove vegetation growth from the previous season.

Hand slashing is the most widespread method used for land clearing. The area cleared by hand slashing in the region during

the wet season was 419,528 ha which represents 64.5 percent of the total planted area. Burning, bush clearance and tractor slashing are less important

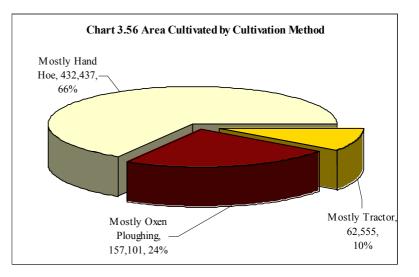

Table 3.7: Land Clearing Methods										
	Wet Season			D	ry Season		Total			
Method of Land Clearing	Number of Households	Area Planted	%	Number of Househol ds	Area Planted	%	Number of Households	Area Planted	%	
Mostly Hand Slashing	218,863	419,528	64.5	851	980	100.0	219,714	420,507	64.6	
Mostly Burning	57,131	109,713	16.9	0	0	0.0	57,131	109,713	16.9	
Most Bush Clearance	31,286	67,004	10.3	0	0	0.0	31,286	67,004	10.3	
No Land Clearing	12,378	42,507	6.5	0	0	0.0	12,378	42,507	6.5	
Mostly Tractor Slashing	2,762	11,522	1.8	0	0	0.0	2,762	11,522	1.8	
Total	322,420	650,274	100.0	851	980	100.0	323,271	651,254	100.0	

methods of land clearing and they represent 16.9, 10.3 and 1.8 percents respectively (Table 3.7)

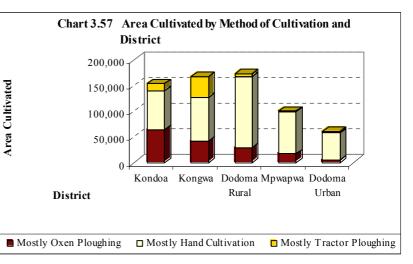

3.5.2 Methods of Soil Preparation

Hand cultivation is mostly used for soil preparation as it has been used in an area of 432,437 ha which represents 66 percent of the total planted area, followed by ox-ploughing (157,101 ha, 24%) and tractor ploughing (62,555 ha, 10%) (Chart 3.56). More hand cultivation was used during wet season with 66 percent of total planted area in the wet season against 10 percent of the total planted area in the dry season. Oxen ploughing was more common in the dry season with 90 percent of the total planted area in the dry season against 24 percent

of the planted area in the wet season. Tractor ploughing was done on 10 percent of the total planted area in the wet season, however there was no tractor ploughing during the dry season.

In Dodoma region, Kondoa district has the largest planted area cultivated using oxen (63,742 hectares, 40.6%) followed by Kongwa (42,084 ha, 26.8%), Dodoma Rural (28,894 ha, 18.4%), Mpwapwa (17,341 ha, 11.0%) and Dodoma Urban (5,040 ha, 3.2%) (Chart 3.57). Tractor ploughing was more prominent in Kongwa district with 64 percent of the area cultivated using tractors in the region.

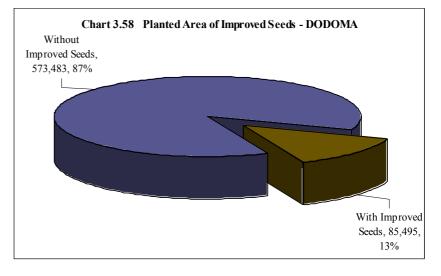

During the wet season, 73.7 percent of the total area cultivated using oxen was planted with cereals, followed by oil seeds (23.0%), pulses (2.3%), root and tubers (0.9%) and fruits & vegetables (0.1%).

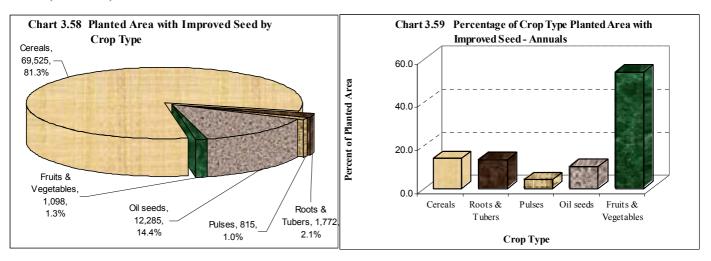

3.5.3 Improved Seeds Use

The planted area with improved seeds was 85,495 ha which represents 13 percent of the total area planted with the annual crops and vegetables. The percentage use of improved seed in the wet season was 13 percent, much higher than the corresponding percentage use for the dry season (1.3%).

Cereals had the largest planted area with improved seeds (69,525 ha, 81% of the

planted area with improved seeds) followed by oil seeds (12,285 ha, 14.4%), roots and tubers (1,771 ha, 2.1%), fruit and vegetables (1,098 ha, 1.3%) and pulses (815 ha, 1.0%) (Chart 3.58). However, the use of improved seeds on fruit and vegetables is much greater than in other crop types (53.8%). Only 4 percent of the planted area for pulses used improved seed (Chart 3.59).

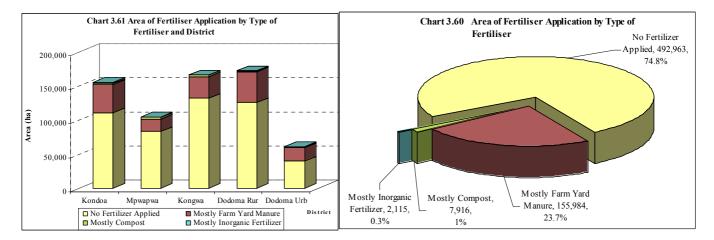

3.5.4 Fertiliser Use

The use of fertilisers on annual crops was very small with a planted area of only 166,015 ha (25.2% of the total planted area in the region). The planted area without fertiliser for annual crops was 492,398 hectares representing 74.8 percent of the total planted area with annual crops. Of the planted area with fertiliser application, farm yard manure was applied to

Table3.8 Planted Area by Type of Fertiliser Use and	District

155,984 ha which represents 23.7 percent of the total planted area (94% of the area planted with fertiliser application in the region). This was followed by compost (7,916 ha, 4.8% of the planted area with fertiliser and 1.2% of the total planted area in the region).

Inorganic fertilisers were used on a very small area representing only 1.6 percent of the area planted with fertilisers (0.4 of the total planted area). The largest planted area with fertiliser (all types) was in Dodoma Rural district (46,542 ha, 28.0% of the total planted area with fertilizer in the region, followed by Kondoa (26.6%), Kongwa (20.6%), Dodoma Urban (12.6%) and Mpwapwa (12.5%) Table 3.8 and (Charts 3.60 and 3.61).

Most annual crop growing households in Dodoma do not use any fertiliser (253,215 households, 78.5%) (Map 3.37). The percentage of the planted area with applied fertiliser was highest for fruit and

vegetables (86.0% of the area planted with these fruit and vegetables during the wet season. This was followed by cereals (28.6%), pulses (19.4%), oil seeds (13.7%) and roots & tubers (6%).

3.5.4.1 Farm Yard Manure Use

The number of households that applied farm yard manure in their annual crops during the Wet Season was 65,365 and it was applied to 155,886 ha representing 23.7 percent of the total area planted during that season (Table 3.9). Cereals had the highest percent of the planted area applied with farm yard manure (86.5%), followed by oil seeds (9.7%), pulses (2.3%), fruits & vegetables (0.9%) and roots and tubers (0.5%) (Chart 3.62).

However, fruit and vegetables had the highest proportion of the planted area applied with farm yard manure (52.0% of the total area of fruit and vegetables in Dodoma Region). This was followed by cereals (26.9%), pulses (17.8%), oil seeds (12.6%) and roots & tubers (5.9%) (Chart 3.63).

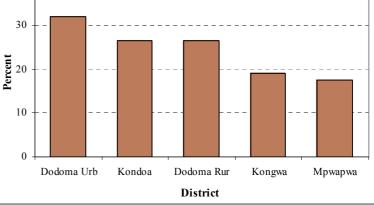

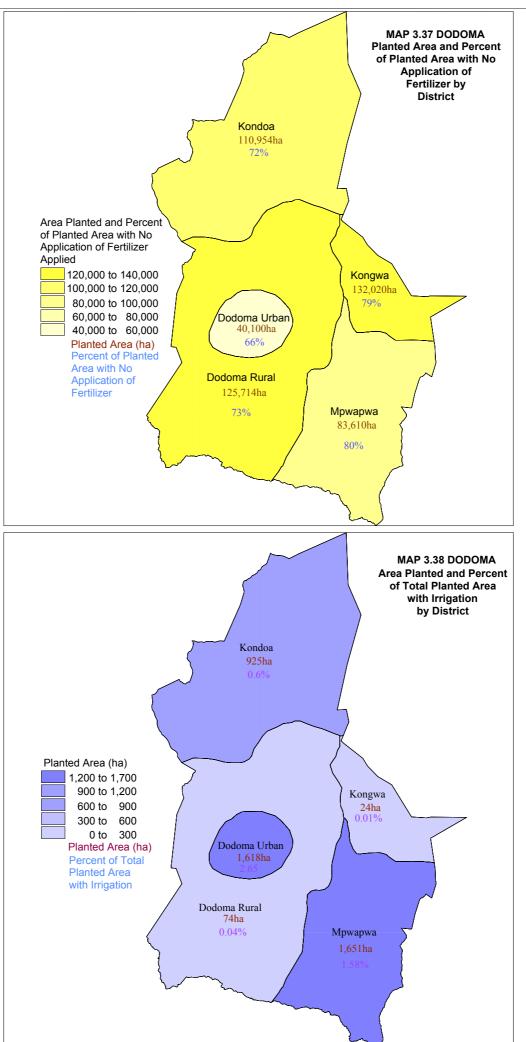

40

Farm yard manure is mostly used in Dodoma Urban (32.0% of the total planted area in the district), followed by Kondoa (26.5%), Dodoma Rural (26.4%), Kongwa (19.0%) and Mpwapwa (17.5%) (Chart 3.64).

For permanent crops, most farm yard manure is used for the production of orange (98.6%), followed by bananas (62.7%) and pawpaw (55.1%).

Chart 3.64 Proportion of Planted Area Applied with Farm Yard Manure by District - DODOMA

3.5.4.2 Inorganic Fertiliser Use

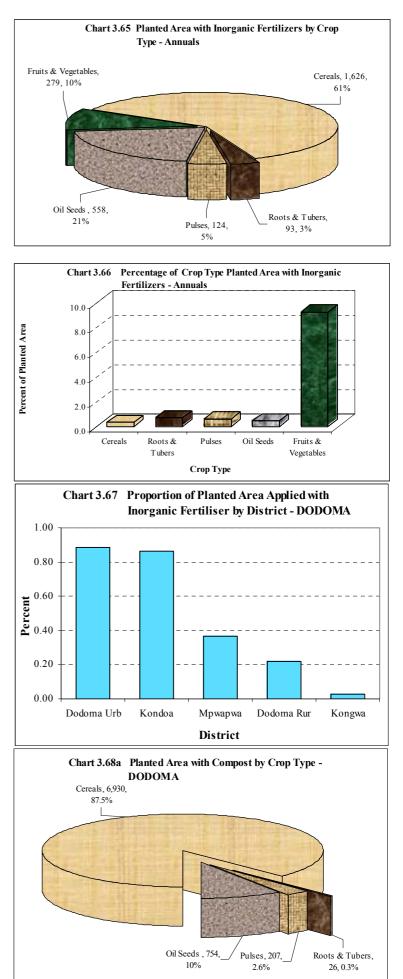

The total planted area applied with inorganic fertilisers in Dodoma region was 2,680 ha which represents 0.4 percent of the total planted area with annuals in the region and 1.6 percent of the total planted area with fertiliser. The number of households that applied inorganic fertiliser on their annual crops during the wet season was 1,724. There was no inorganic fertiliser application during the dry season. The largest area applied with inorganic fertilisers was on cereals (61% of the total area applied with inorganic fertilisers), followed by oil seeds (21%), fruit and vegetables (10%), pulses (5%) and roots and tubers (3%) (Chart 3.65). However, the proportion of fruit and vegetables with inorganic fertilisers was higher than other crop types (9.3%), followed by roots and tubers (0.7%), Pulses (0.6%) oil seeds (0.6%) and cereals (0.3%) (Chart 3.66).

Inorganic fertiliser is mostly used in Dodoma Urban (0.89% of the total planted area in the district), and Kondoa (0.86%), followed by Mpwapwa (0.37%), Dodoma Rural (0.22%) and Kongwa (0.03%) (Chart 3.67).

In permanent crops inorganic fertilisers were used on pigeon peas only (2.3%).

3.5.4.3 Compost Use

The total planted area applied with compost was 7,916 ha which represents only 1.2 percent of the total planted area with annual crops in the region and 4.7 percent of the total planted area with fertiliser in the region. The number of households that applied compost manure on their annual crops during the wet season was 2,849 (Table 3.9). There was no compost manure application during the dry season. The proportion of the area applied with compost was very low for each type of crop (0 to 1.4%); however the distribution of the total area

using compost manure shows that 87.5 percent of this area was cultivated with cereals, followed by oil seeds (9.5%), pulses (2.6%) and roots & tubers (0.3%)(Chart 3.68a).

Compost is mostly used in Mpwapwa (2.1% of the total planted area in the district), followed by Kongwa (1.5%), Dodoma Urban (1.4%), Kondoa (1.1%) and Dodoma Rural (0.4%) (Chart 3.68c).

In permanent crops, the only crops that compost was mostly used on was durian (100.0%) and rubber vine fruit (100.0%) followed by pigeon peas (3.8%), guava (3.6%), mango (3.5%) and banana (2.5%).

3.5.5 Pesticides Use

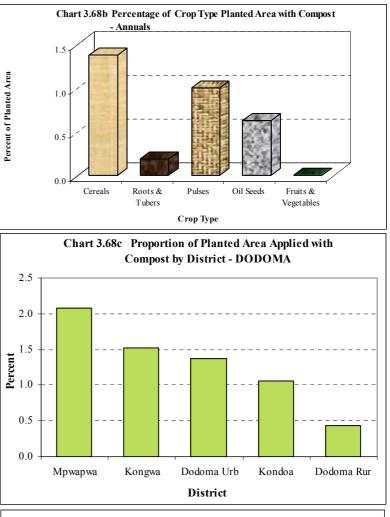

Pesticides are chemicals used for controlling insects, diseases and weeds. This section analyses the use of these chemicals by smallholders on both annual and permanent crops in Dodoma region. Pesticides were applied to a planted area of 40,678 ha of annual crops and vegetables.

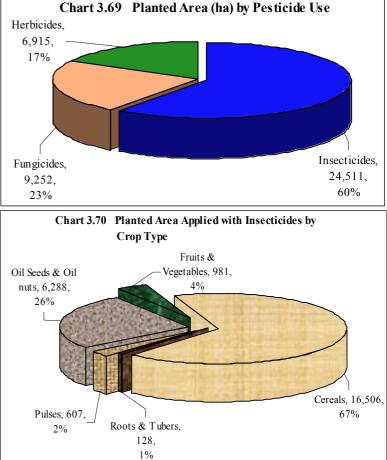

Insecticides are the most common pesticide used in the region (60% of the total area applied with pesticides). This was followed by fungicides (23%) and herbicides (17%) (Chart 3.69).

3.5.5.1 Insecticide Use

The planted area applied with insecticides was 24,511 ha which represents 3.7 percent of the total planted area for annual crops and vegetables.

Cereals had the largest planted area applied with insecticides (16,506ha, 67% of the total planted area with insecticides) followed by oil seeds (6,288 ha, 26%), fruit and vegetables (981 ha, 4%), pulses (607 ha, 2%) and roots & tubers

(128 ha, 1%) (Chart 3.70). of the total area planted with fruit and vegetables 48.4 percent received insecticides whilst other crop types received very small amounts (oil seeds (5.2%), cereals (3.3%), pulses (3.0%) and roots & tubers (1.0%) (Chart 3.71).

Annual Crops with more than 50 percent insecticide use were cabbage (100%), spinach (100%), carrot (100%), onions (72.4%) and amaranths (54.8%).

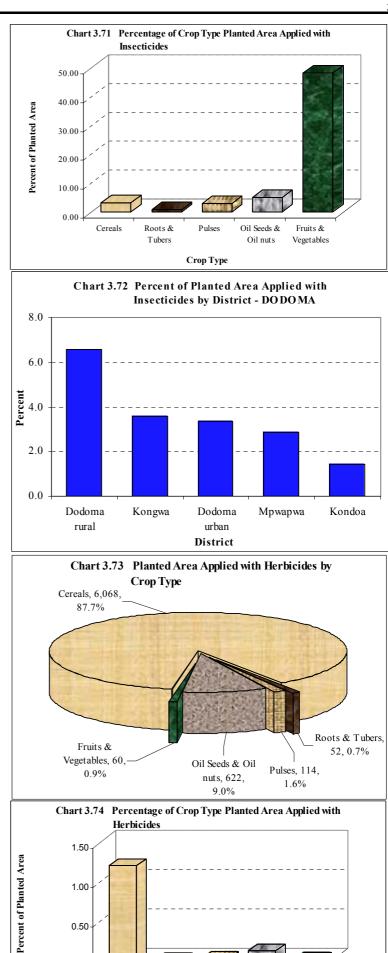

Dodoma Rural had the highest percent of planted area with insecticides (6.6% of the total planted area with annual crops in the district), followed by Kongwa (3.6%), Dodoma Urban (3.3%) and Mpwapwa (2.9%). The smallest percentage use was recorded in Kondoa district (1.4%) (Chart 3.72).

3.5.5.2 **Herbicides Use**

The planted area applied with herbicides in Dodoma region was 6,915 ha, representing 1.1 percent of the total planted area for annual crops and vegetables. Cereals had the largest planted area applied with herbicides (6,068 ha, 87.7%) followed by oil seeds (662 ha, 9.0%), pulses (114 ha, 1.6%), fruit and vegetables (60 ha, 0.9%) and roots and tubers (52 ha, 0.7%) (Chart 3.73).

The percent of herbicide use on cereals was much greater than on other crop types (1.2% of cereals had an application of herbicides) while only 0.01 percent of fruit and vegetables was applied with herbicides (Chart 3.74).

In terms of planted area were tomatoes (5.24%), sorghum (1.66%), maize (1.28%), bambaranuts (0.99%), bulrush millet (0.75%) and groundnuts (0.73%).

Crop Type

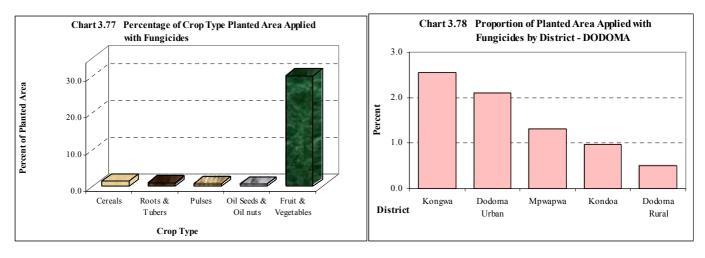

Kongwa had the highest percent of planted area with herbicides (2.1% of the total planted area with annual crops in the district), followed by Mpwapwa (1.1%), Dodoma Urban (1.0%), and Dodoma Rural (0.6%). The smallest percentage use was recorded in Kondoa district (0.33%) (Chart 3.75).

3.5.5.3 Fungicide Use

The total planted area applied with fungicides was 9,252 ha, representing 1.4 percent of the total planted area for annual crops and vegetables. The fungicides were applied on crops planted during the wet season only. Cereals had the largest planted area applied with fungicides (7,673ha, 82.9%) followed by oils seeds (693 ha, 7.5%), fruit and vegetables (611 ha, 6.6%), pulses (147 ha, 1.6%) and roots and tubers (128 ha, 1.4%) (Chart 3.76).

However, the percentage use of fungicide on fruit and vegetables was much greater than in other crop types (30.1%), whilst only 0.6 percent of oil seeds and oil nuts had an application of fungicides (Chart 3.77).

Annual crops that had more than 15 percent of their planted area with fungicide applied were cabbages (100%), spinach (54.7%), onions (38.5%), tomatoes (37.6%) and chillies (15.8%). Each of the remaining annual crops had less than 3 percent fungicide use.

Kongwa had the highest percent of planted area with fungicide (2.5% of the total planted area with annual crops in the district). This was closely followed by Dodoma Urban (2.1%). The smallest percentage use was recorded in Dodoma Rural district (0.5%) (Chart 3.78).

3.5.6 Harvesting Methods

The main harvesting method for cereals was by hand. Very small amounts of maize were harvested by machine (0.4%). All other cereals and annual crops were mainly harvested by hand.

3.5.7 Threshing Methods

Hand threshing was the most common method used, with 80 percent of the total area planted with cereals during the long rainy being threshed by hand. Draft animals, human powered tools and engine driven machines were only used on crops harvested from 0.5, 5.6 and 7.8 percent of the total planted area respectively.

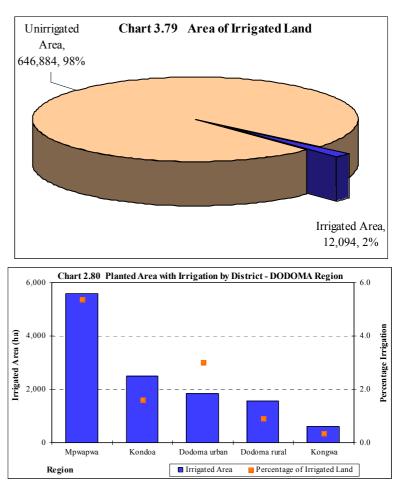

3.6 Irrigation

Water is the limiting factor to crop production in the majority of areas in Tanzania and without water most other agricultural practices applied to crops do not result in significant increases in yields. This section deals with the area under irrigation for different crops and the means by which water was extracted from the source and applied to the field.

3.6.1 Area Planted with Annual Crops and Under Irrigation

In Dodoma region, the area of annual crops under irrigation was 12,094 ha representing 2 percent of the total area planted (Chart 3.79). The area under irrigation during the dry season was 15 ha accounting for 0.12 percent of the total area under irrigation. Cabbage is the only crop that was irrigated during the dry season covering 100 percent of the area planted with irrigation during the dry season, whilst 73 percent of the vegetables were irrigated in the wet season.

The district with the largest planted area under irrigation with annual crops was Mpwapwa (5,595 ha, 46% of the total irrigated planted area with annual crops in the region). This is followed by Kondoa with (2,497 ha, 21%) and then Dodoma Urban (1,836 ha, 15%). When expressed as a percentage of the total area planted in each

district, Mpwapwa had the highest with 5.4 percent of the planted area in the district under irrigation. This is followed by Dodoma Urban (3.0%), Kondoa (1.6%), Dodoma Rural (0.9%) and Kongwa (0.4%) (Chart 3.80 and Map 3.38).

Of all the different crops and in terms of proportion of the irrigated planted area, spinach, chillies, cabbage and carrots were the most irrigated crops with 100 percent irrigation followed by tomatoes (86%), amaranths (83%) and onions (53%). In terms of crop type, the area under irrigation with roots and tubers was 6,688 ha (55.4% of the total area under irrigation), followed by cereals (2,458 ha, 20.3%), fruit and vegetables (1,471 ha, 12.2%), oil seeds and nuts (945 ha, 7.8%) and pulses (517 ha, 4.3%). Finger millet was the only cereal crop with no irrigation

The area of fruit and vegetables under irrigation was 1,471 ha representing 72.6 percent of the total planted area with fruit and vegetables. Cabbage, carrots, spinach and chillies were the most irrigated crops.

The area under irrigation in Dodoma region appears to have increased over the 10 year period from 2,114 hectares in 1995/96 to 12,094 hectares in 2002/03 (Chart 3.81). This may not be statically significant due to the small number of households sampled with irrigation.

3.6.2 Sources of Water Used for Irrigation

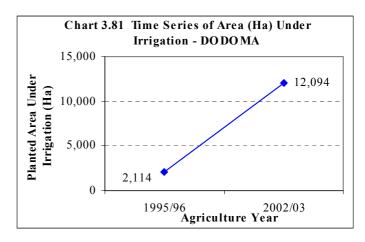

The main source of water used for irrigation was from wells (49.0% of households with irrigation). This was followed by river (28.9%) and canals (12.3%). Only 1.0 percent of the households used water from lakes and the proportion of households that used dams, pipe water and bore holes as a source of water for irrigation were very few (4.4%, 3.9% and 1.4% respectively) (Chart 3.82).

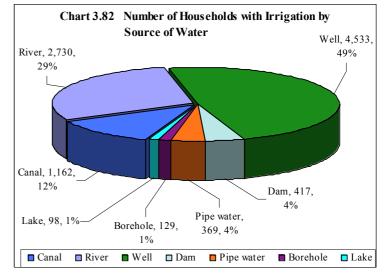

All households using irrigation in Kongwa and Dodoma Rural obtain irrigation water from rivers and wells respectively.

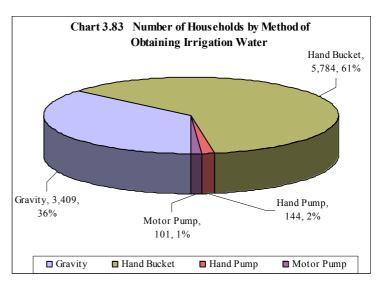

3.6.3 Methods of Obtaining Water for Irrigation

Hand bucket was the most common means of getting water for irrigation with 61.3 percent of households using this method, followed by gravity (36.1% of households with irrigation). The remaining methods (hand pump and motor pump) were of minor importance (Chart 3.83).

Hand bucket was used by most households with irrigation in Dodoma Urban district (56.9%), followed by Mpwapwa (17.8%), Kondoa (17.4%) and Dodoma Rural (7.9%). There was no hand bucket irrigation in Kongwa. Gravity method was

more common in Mpwapwa with 82.3 percent of households using the method to get water for irrigation, followed by

Kondoa (8.5), Dodoma Urban (5.8%) and Kongwa (3.4%). No households reported using gravity method in Dodoma Rural district.

Although the method of obtaining irrigation water by hand bucket and gravity were the most common method in all districts, Kondoa and Dodoma Urban districts used some hand and motor pumps for obtaining water.

3.6.4 Methods of Water Application

Most households used buckets/watering cans (61% of households using irrigation) as a method of field application. This was followed by flood irrigation (32%). Sprinklers and water hose were not widely used (5% and 2% respectively).

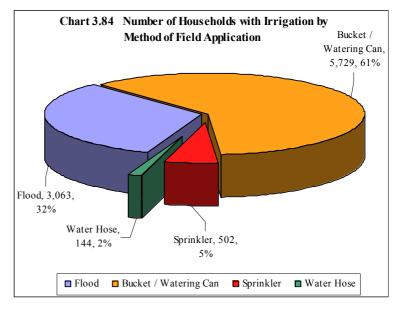

3.7 Crop Storage, Processing and Marketing

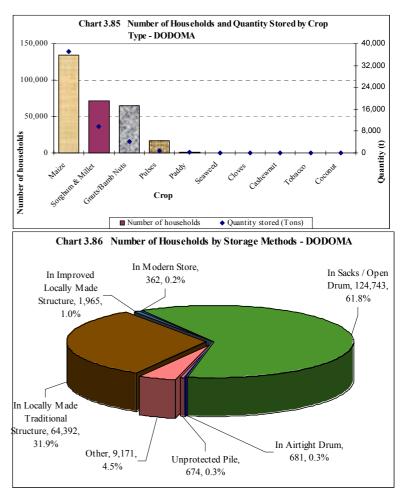

3.7.1 Crop Storage

Crop storage means keeping a crop for a certain period of time as food for the household, in order to sell at higher prices or as seed for planting in the following season.

The results for Dodoma region show that there were 288,389 crop growing households (89% of the total crop growing households) that stored various agricultural products in the region.

The most important stored crop was maize with 133,858 households storing 37,052 tonnes as of 1st January 2004. This was followed by Sorghum and millet (71,917 households, 9,743t), groundnuts and bambaranuts (64,253 households, 4,084t), pulses (16,974 households, 793t) and paddy (1,388 households, 276t). Other crops were stored in very small amounts.

3.7.1.1 Methods of Storage

The region had 124,743 crop growing households storing their produce in sacks and/or open drums (61.8% of households that stored crops in the region). The number of households that stored their produce in locally made traditional structures was 64,392 (31.9%). This was followed by improved locally made structure (1,965 households, 1.0%), airtight drum (681 households, 0.3%), unprotected piles (674 households, 0.3%) and modern stores (362 households, 0.2%) (Chart 3.86).

Storage in sacks and/or open drum was the dominant storage method in most districts, with the highest percent of households

in Kongwa using this method (79% of the total number of households storing crop products). This is followed by Kondoa (73%), Mpwapwa (58%), Dodoma Urban (54%) and Dodoma Rural (46%).

The highest percent of households using improved locally made structures was in Dodoma Rural and Mpwapwa districts (53% and 39% of the total number of households storing crops respectively), followed by Dodoma Urban (34%), Kongwa (17%) and Kondoa (16%) (Chart 3.87).

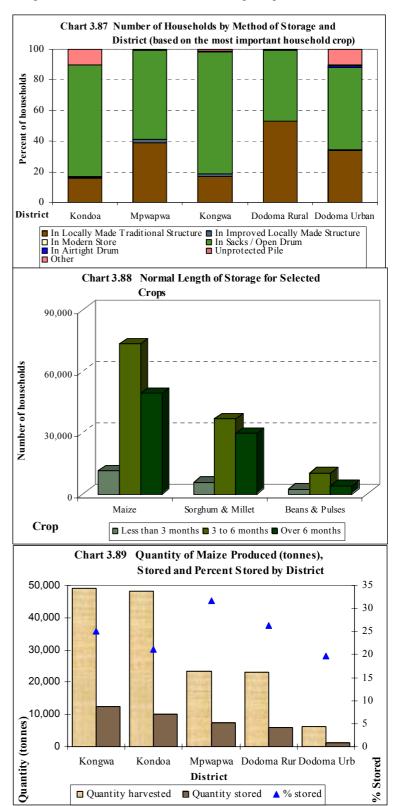

3.7.1.2 Duration of Storage

Most households stored their produce for a period of 3 to 6 months (52.9% of the households storing crops) followed by those who stored for a period of over six months. The minority of households stored their crop for a period of less than 3 months (7.6%).

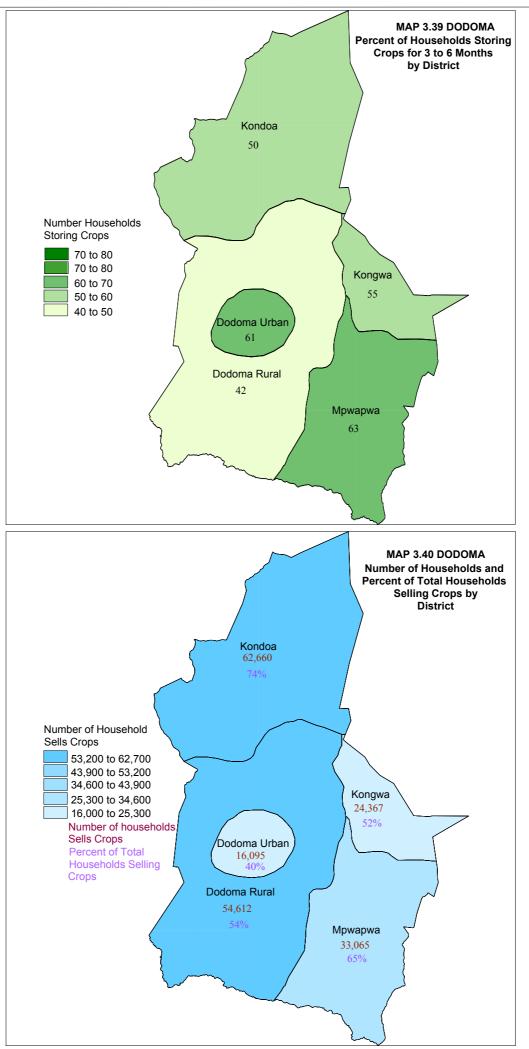

Most households that stored maize stored for a period of 3 to 6 months followed by those storing for over 6 months. A small number of households stored maize for the period of less than 3 months (Chart 3.88).

The proportion of households that stored their produce for the duration of 3 to 6 months was highest in Mpwapwa district (63%) followed by Dodoma Urban (61%), Kongwa (55%), Kondoa (50%) and Dodoma Rural (42%) (Map 3.39).

District comparison of duration of storage cannot be done for all crops combined. However, the

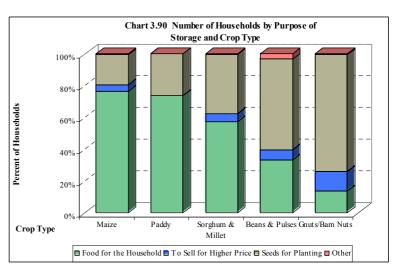

analysis has been done for maize only as it is the most commonly stored crop. In general, quantity stored was related to the quantity produced. Districts with greater production had a higher percent of their crop stored as on 1st October 2003 (Chart 3.89). However, households in Kondoa and Kongwa district stored relatively little maize in comparison to the quantity produced indicating that the quantity stored was determined by the food and seed requirement of the household and not to sell during the "off-season" when the farm gate price of maize is higher.

3.7.1.3 Purposes of Storage

Subsistence food crops (maize, paddy, sorghum and millet,) are mainly stored for household consumption. The percent of households that stored maize for household consumption as the main purpose of storage was 76.6 percent, followed by seed for planting (19%) and selling at higher price (4.1%). A high percent of the households that stored pulses and groundnuts was for planting purpose (seeds) (57.3% and 73.7% respectively).

3.7.1.4 The Magnitude of Storage Loss

About 83 percent of households that stored crops had little or no loss, however the proportion of households that experienced a loss of more than a quarter was higher for food crops than crops that are stored for seeds such as groundnut and bambara nuts.

The proportion of households that reported a storage loss of more than a quarter was greatest for and sorghum millets (6.4% of the total number of households that stored

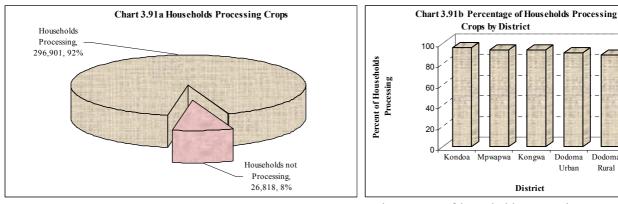

Table 3.10: Number of Households Storing Crops by Estimated Storage Loss and Crop

Estimated Storage Loss					6				
	Little or n	o Loss	Up to 1/4	Loss	Betwee and 1/2		Over 1/2	Loss	
Сгор	Number of House holds	%	Number of House holds	%	Number of House holds	%	Number of House holds	%	Total
Maize	99,932	74.7	25,454	19.0	5,016	3.7	3,455	2.6	133,858
Paddy	1,125	81.0	263	19.0	0	0.0	0	0.0	1,388

Beans & Pulses	14,235	83.9	2,324	13.7	415	2.4	0	0.0	16,974
Groundnuts/Bambara Nuts	62,301	97.0	1,266	2.0	568	0.9	117	0.2	64,253
Total	239.045	82.8	35.375	12.3	9.367	3.2	4.804	1.7	288,590

crops). This was followed by maize (6.3%), beans and pulses (2.4%) and groundnuts and bambara nuts (1.1%). Households that stored paddy had a loss of less or equal to 245 percent (Table 3.10).

3.7.2 Agro-processing and By-products

Agro processing refers to a process that converts a crop product from one form to another form in order to add value or increase the palatability of the product. Agro-processing was practiced in most crop growing households in Dodoma region (296,901 households, 92% of the total crop growing households) (Chart 3.91a).

The percent of households processing crops was very

Dodoma

Rural

high in all districts (above 80%) (Chart 3.91b).

62

3.7.2.1 Processing Methods

Most crop processing households processed their crops using neighbour's machines (208,367 households, 70% of households processing crops). This was followed by those processing on-farm by hand (61,046 households, 21%), on farm by machine (14,924 households, 5%) and by trader (10,146 households, 3%).

Although processing by neighbours machine was the most common processing method in all districts in Dodoma region, district differences exists. Dodoma Rural has a higher percent of hand processing on farm than other districts (30%), followed by Mpwapwa (24%) and Kondoa (18%). Processing by trader was practised in Mpwapwa and Kondoa districts only (13% and 5% respectively), whilst processing on farm by machine though small, was more prevalent in Dodoma Urban, Kondoa and Mpwapwa (Chart 3.92).

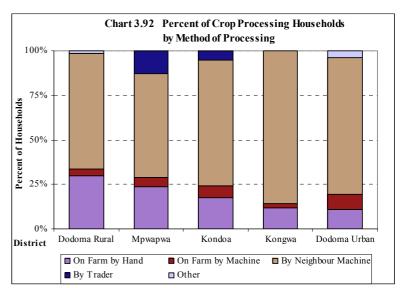

3.7.2.2 Main Agro-processing Products

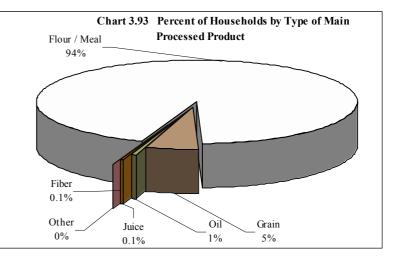

Two types of products can be produced from agro-processing namely, main product and by-product. The main product is the major product after processing and the by-product is secondary product after processing. For example the main product after processing maize is normally flour whilst the by-product is the bran.

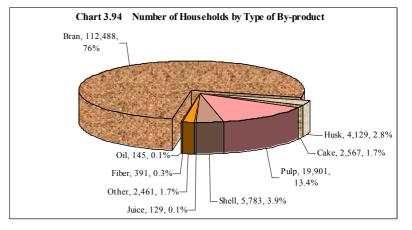

The main processed product was flour/meal with 279,153 households processing crops into flour (94%) followed by grain with 15,155 households (5.1%). The remaining products were produced by a small number of households (Chart 3.93).

The number of households producing byproducts accounted for 49.8 percent of the households processing crops. The most common by-product produced by crop processing households was bran (112,488 households 76%), followed by pulp (19,901 households, 13%), shell (5,783 households, 4%) and husk (4,129 households, 3%). The remaining by-products

were produced by a small number of households (Chart 3.94).

3.7.2.3 Main Use of Primary Processed Products

Primary processed products were mainly used for household/human consumption, fuel for cooking, for selling and for animal consumption. The most important use was for household/human consumption which was reported by 96.5 percent of the total households that used primary processed product Districts that used primary products as fuel for cooking were Dodoma Rural, Kondoa and Dodoma Urban (Chart 3.95).

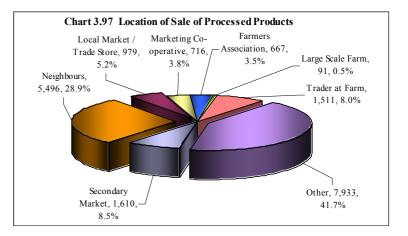

Out of 9,324 households that sold processed products, 4,817 (51.7% of the total number of households selling processed products in the region) were from Mpwapwa followed by Kondoa (2,242 households, 24.0%), Kongwa (1,405)households, 15.1%), Dodoma Rural (457)households, 4.9%) and Dodoma Urban (403 households, 4.3%) (Chart 3.96).

Compared to other districts in Dodoma region, the highest proportion of Mpwapwa had households that sold processed products (6.7%). This is followed by Kongwa (2.2%), Kondoa (2.0%), Dodoma Urban (0.6%) and Dodoma Rural (0.3%).

3.7.2.4 Outlets for Sale of Processed Products

Most households that sold processed products sold to other unspecified places (7,933 households, 42% of households that sold processed crops). This was followed by selling to neighbours (5.496)households, 29%), trader at farm (1,511)households, 8%), secondary market (1,610)households, 8%), local market and/or trade store (979 households, 5%), marketing cooperatives (716 households, 4%), farmers associatins (667 households, 4%) and large scale farms (91 households, 0.5%) (Chart 3.97).

Chart 3.95 Use of Processed Product Human Consumption, 450,186, 96.5% Other, 790 Fuel for Cooking, 0.2% 1,537, 0.3% Animal Did Not Use, Sale Only, 9,324, Consumption, 2,430, 0.5% 2.0% 2,290, 0.5% Chart 3.96 Percentage of Households Selling **Processed Crops by District** 60.00 Percentage of Households 45.00 30.00

There are large differences between districts in the proportion of households selling processed products with Kongwa district having the largest percent of households in the region selling to neighbours (54.5%), whereas Dodoma Rural had only 12.8 percent. Dodoma Rural had a higher percent of households relying on secondary market than other outlets.

Mpwapwa

Kondoa

District

Kongwa

Dodoma

Urban

Dodoma

Rural

Household /

Compared to other districts, Dodoma Urban had the highest percent of households selling processed products to local markets/trade stores at farm. The district with the highest proportion of households selling processed products to marketing cooperatives was Kongwa whilst the sale of processed produce to farmer associations was found in Kongwa and Kondoa districts only (Chart 3.98).

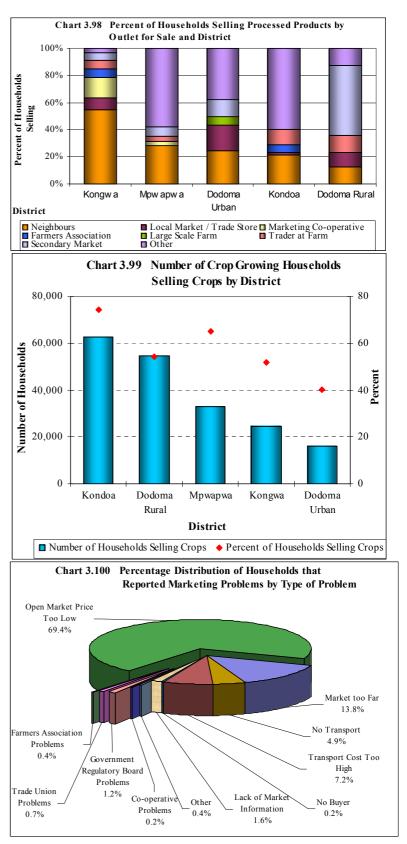

3.7.3 Crop Marketing

The number of households that reported selling crops was 190,800 which represents 59.1 percent of the total number of crop growing households. The percent of crop growing households selling crops was highest in Kondoa (74.2%) followed by Mpwapwa (65.0%), Dodoma Rural (54.4%), Kongwa (51.7%) and Dodoma Urban (40%) (Chart 3.99 and Map 3.40).

3.7.3.1 Main Marketing Problems

Low price for agricultural produce was the main marketing problem reported by households (69.4% of crop growing households that reported main marketing problems).

Apart from low market prices, other problems were long distances to the markets (13.8%), high transport costs (7.2%), lack of transport (4.9%), lack of market information (1.6%) and the government regulatory Boards problems (1.2%). Other marketing problems are minor, representing less than 1 percent of the total reported problems (Chart 3.100).

3.7.3.2 Reasons for Not Selling Crops

The main reason for not selling crops was reported as "insufficient production to sell", representing 93.2 percent of the smallholders. The proportion of households reporting other reasons for not selling were extremely low (Table 3.11).

Table 3.11 Reasons for Not Selling Crop Produce

	Household	
Main Reason	Number	%
Production Insufficient to Sell	138,819	93.2
Other	5,967	4.0
Price Too Low	2,168	1.5
Trade Union Problems	351	0.2
Co-operative Problems	365	0.2
Market Too Far	1,105	0.7
Government Regulatory Board Problems	230	0.2
Total	149,005	100.0

3.8 Access to Crop Production Services

3.8.1 Access to Agricultural Credits

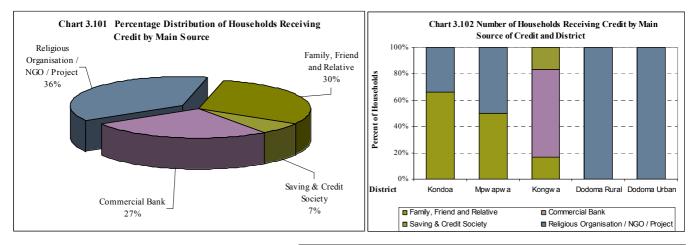

The census results shows that very few agricultural households (1,759, 0.5%) in Dodoma region accessed credit, of which 1,493 (85%) were maleheaded households and 266 (15%) were female headed households. In Kongwa, Dodoma Rural and Dodoma Urban districts only male headed households got agricultural credit whereas in Kondoa and Mpwapwa both male and female headed households accessed agricultural credits (Table 3.12).

Table 3.12Number of AgriculturalHouseholds that Received Credit by Sex ofHousehold Head and District

	Male	;	Femal		
District	Number	%	Number	%	Total
Kondoa	285	67	142	33	428
Mpwapwa	124	50	123	50	247
Kongwa	702	100	0	0	702
Dodoma Rural	181	100	0	0	181
Dodoma Urban	201	100	0	0	201
Total	1,493	85	266	15	1,759

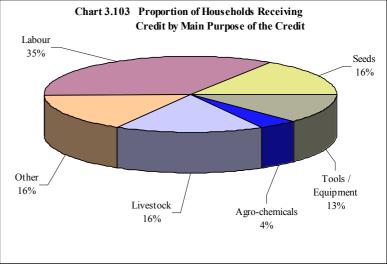

3.8.1.1 Source of Agricultural Credit

The major agricultural credit provider in Dodoma region were Religious Organizations/Non Govermental Organizations/projects which collectively provided credit to 650 agricultural households (36% of the total number of households that accessed credit), followed by Family, Friends and relatives (30%), commercial banks (27%) and saving and credit societies (7%) (Chart 3.101). Religious Organizations/Non Govermental Organizations/ projects were the sole source of credit in Dodoma Rural and Dodoma Urban districts whilst Family, Friends and Relatives were major credit provider in Kondoa district. Commercial Banks and Saving and Credit Societies were involved in providing credit to households in Kongwa district only (Chart 3.102).

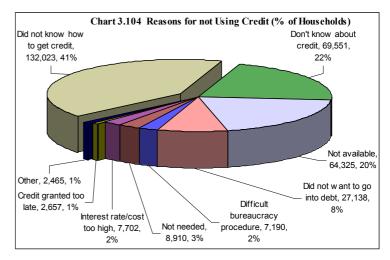

3.8.1.2 Use of Agricultural Credits

A large proportion of the agricultural credit provided to agricultural households in the region was used on hiring labour (35%), followed by livestock rearing (16%), purchasing of seeds (16%), other unspecified activities (16%), tools and equipments (13%) and agro-chemicals (4%) (Chart 3.103).

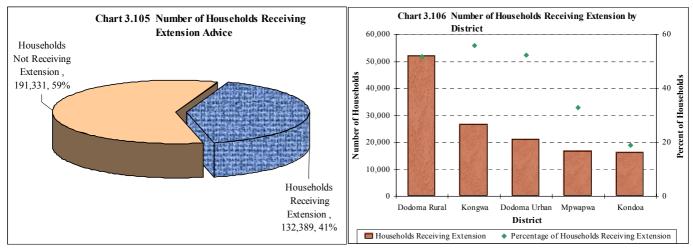

3.8.1.3 Reasons for Not Using Agricultural Credits

The main reason for not using agricultural credit as a source of finance was little credit awareness accounting for 63 percent of the agricultural households ("did not know how to get credit" and "don't know about credit"). This was followed by "non-availability of credit" reported by 20 percent of households and "not wanting to go into debt" (8%). The rest of the reasons collectively accounted for less than 10 percent of the agricultural households.

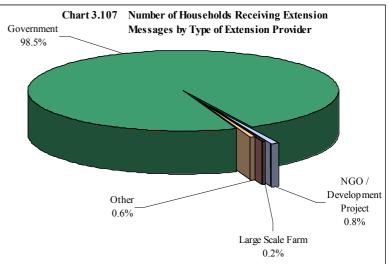

3.8.2 Crop Extension

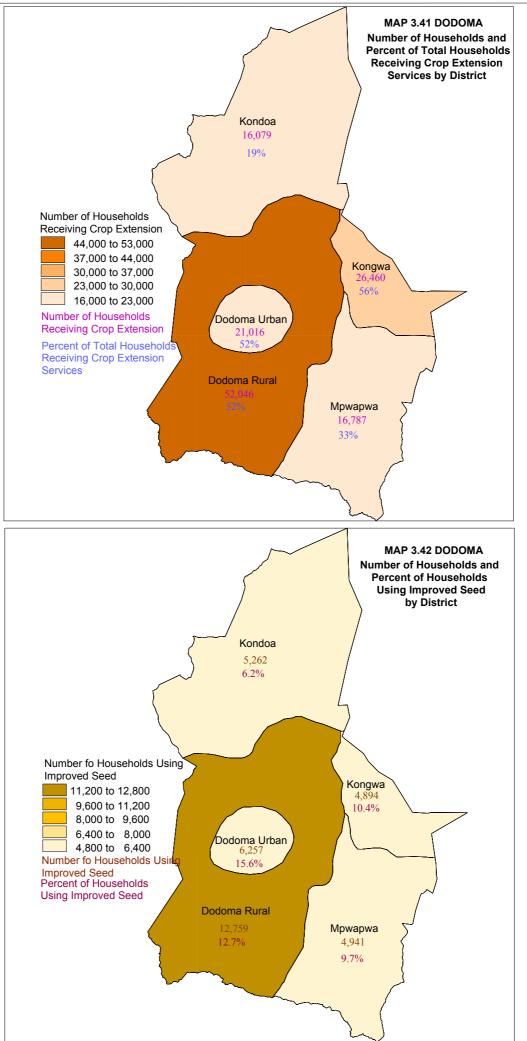

The number of agricultural households that received crop extension was 132,389 (41% of total crop growing households in the region) (Chart 3.105). Some districts have more access to extension services than others, with Kongwa having a relatively high proportion of households that received crop extension messages (56.0%) followed by Dodoma Urban (52.3%), Dodoma Rural (51.8%), Mpwapwa (32.9 and Kondoa (19.0%) (Chart 3.106 and Map 3.41).

3.8.2.1 Sources of Crop Extension Messages

Of the households receiving extension advice the Government provided the greatest proportion (98.5%, 124,380 households). NGOs provided 0.8 percent, large scale farms 0.2 percent and the remaining providers less than 0.6 percent (Chart 3.107), however district differences exist with the proportion of the households receiving advice from government services ranging from 92.4 percent in Dodoma Urban district to 98.2 percent in Kondoa district.

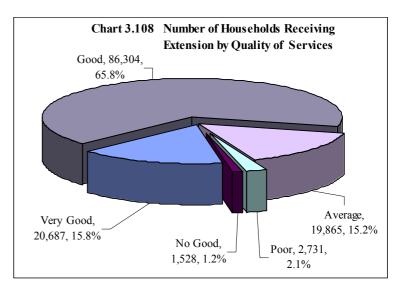

3.8.2.2 Quality of Extension29/01/2007

An assessment of the quality of extension indicates that 65.8 percent of the households receiving extension ranked the service as being "good" followed by "very good" (15.8 %) and "average" (15.2%). Very few households reported the services to be "poor" (2.1%) and "no good" (1.2%) (Chart 3.108).

However, care should be exercised when making decisions on quality of extension and also other variables in the extension report as all the enumerators were extension agents and some degree of bias is expected.

3.9 Access to Inputs

Access to inputs in this section refers to all crop growing households in Dodoma regardless of whether the household grew annual or permanent crops. In previous sections the reference was on annual crops only. Because of this, the figures presented in this section may be different from the previous section on inputs (Section 2.6). Data on source of inputs is only found in this section and it applies to both annual and permanent crops.

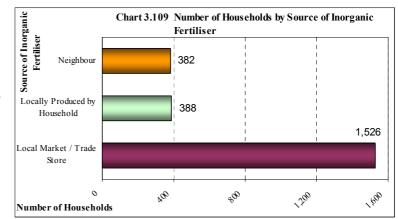

A small number of households use inputs and this is particularly true of inputs that are not produced on farm i.e., improved seeds, fungicides, inorganic fertiliser and herbicides. In Dodoma region, farm yard manure is used by 96,837 households which represents 30.0 percent of the total number of crop growing households. This is followed by households using improved seeds (10.6%), pesticide/fungicide (2.8%), compost (1.4%), inorganic fertiliser (0.7%), and herbicide (0.1%) (Table 3.13).

Table 3.13 Access to Inputs

		Households With Access to Input		Households Without Access to Inputs		
Type of Input	Number	%	Number	%		
Farm Yard Manure	96,837	30.0	227,755	70.5		
Improved Seeds	34,114	10.6	289,414	89.6		
Pestcides/Fungicide	8,951	2.8	314,771	97.4		
Compost	4,523	1.4	319,239	98.8		
Inorganic Fertiliser	2,295	0.7	321,292	99.4		
Herbicide	415	0.1	323,138	100.0		

3.9.2 Inorganic Fertilisers

Smallholders that use inorganic fertiliser in Dodoma region mostly purchase it from the local markets/trade stores (66.5% of the total number of households using inorganic fertiliser). The remaining sources of inorganic fertilisers are minor (Chart 3.109).

Most households resides 20 kilometers and above from the source of inorganic fertilisers (38%), followed by less than 1 km (33%) and between 3 and 10 km (16.6%) (Chart 3.110). Due to the very small number of households using inorganic fertilisers coupled with the small number of households responding to "non available" (20%) as the reason for not using, it may be assumed that access to inorganic fertiliser is not the main reason for not using. Other reasons such as costs are more

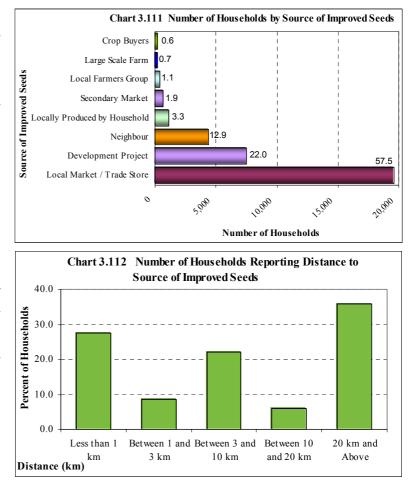

important with 58 percent of households responding to cost factors as the main reason for not using. In other words, it is assumed that if the cost was affordable, the demand would be higherand fertiliser would become more accessable. More smallholders use inorganic fertilisers in Kondoa than in other districts in Dodoma region (55.9% of households using inorganic fertilisers), followed by Dodoma Urban (17.5%), Mpwapwa (16.6%) and Dodoma Rural (10.0%). There was no inorganic fertiliser use in Kongwa district. 101

3.9.3 Improved Seeds

The percent of households that used improved seeds was 10.6 percent of the total number of crop growing households. Most of the improved seeds are from the local market/trade store (57.5%). Other less important sources of improved seed development are projects (22.0%), neighbours (12.9%) and locally produced by household (3.3%). Only 0.7 percent of households using improved seeds obtain them from large scale farms (Chart 3.111).

Access to improved seeds is no better than access to chemical inputs with 27.4 percent of households obtaining the input within 1 km of the homestead (Chart 3.112) compared to 30 percent for chemical inputs. The higher use of improved seeds compared to other inputs is an indication that the availability is not the main prohibiting factor for the use of inputs but rather other factors such as cost.

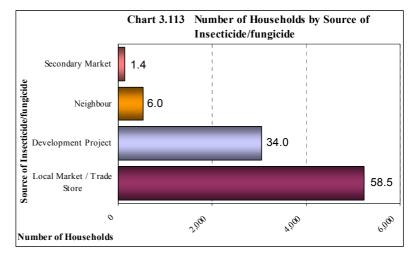

The district that mostly uses improved seeds is Dodoma Rural with 37.4 percent of the total number of households using improved seeds in Dodoma region, followed by Dodoma Urban (18.3%) and Kondoa (15.4%). Percents of the crop growing households in Mpwapwa and Kongwa districts that used improved seeds were 14.5 and 14.3 respectively (Map 3.42).

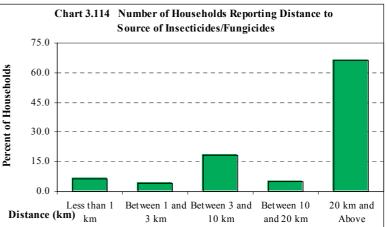

3.9.4 Insecticides and Fungicides

Most smallholder households using insecticides and fungicides mainly purchase them from local markets/trade stores (58.5% of the total number of households using insecticides/fungicides), followed by development project (34.0%), neighbours (6.0) and secondary market (1.4%) (Chart 3.113).

Chart 3.114 shows that most agricultural households (66.4% of the crop growing households which used insecticides and fungicides) obtained the inputs from the distance of 20 or more kilometres.

The small number of households using insecticides/fungicides coupled with the 15 percent of households responding to "non availability" as the reason for not using fungicides, may lead to the assumption that access is not the main reason for not using. Other reasons such as costs are more important

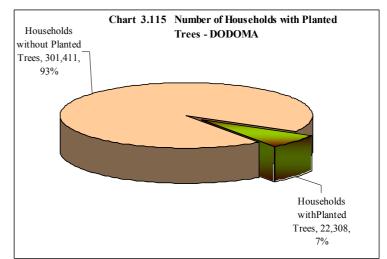

with 64 percent of households responding to cost factors as the main reason for not using. In other words, it is assumed that if the cost was affordable, the demand would be higher and access to insecticides/fungicides would be improved. Fungicide is mostly used in Dodoma Rural district with 38.6 percent of the total number of households using fungicide, followed by Dodoma Urban (26.8%), Kongwa (14.4%), Mpwapwa (12.2%) and Kondoa (8.0%).

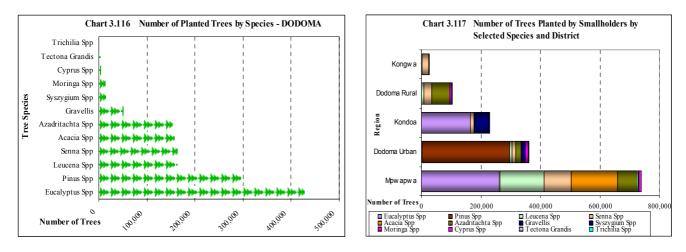

3.10 Tree Planting

The number of households involved in tree farming in Dodoma region was 22,308 representing 7 percent of the total number of agriculture households (Chart 3.115).

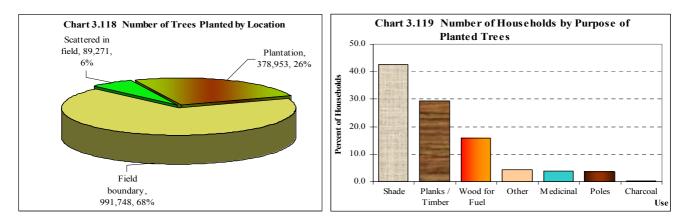

The number of trees planted by smallholders on their allotted land was 1,459,972 trees. The average number of trees planted per household that plants trees on their land was 65 trees.

The main species planted by smallholders is Eucalyptus (430,229 trees, 29.5%), followed by Pinus (295,545, 20.2%), Leucena spp (164,642, 11.2%), Senna spp (163,994, 11.2%), Acacia spp (156,231, 10.7%) and Azadrachta (154,435, 10.6%). The remaining trees species are planted in comparatively small numbers (Chart116.). Mpwapwa has the largest number of trees planted by smallholders than any other district (50.6%) and it has more Eucalyptus than other species. This is followed by Dodoma Urban (24.8%) which is dominated by Pinus, Kondoa (15.8%) dominated by Eucalyptus, Dodoma

Rural (7.0) dominated by Azadrachta spp and Kongwa (1.8%) which is mainly planted with Senna spp (Chart 3.117 and Map 3.43).

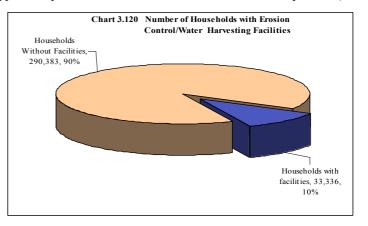

Smallholders mostly plant trees on the boundary of fields. The proportion of trees that are planted on field boundaries is 68 percent, followed by trees planted in a plantation or coppice 26 percent and then trees scattered in fields 6 percent (Chart

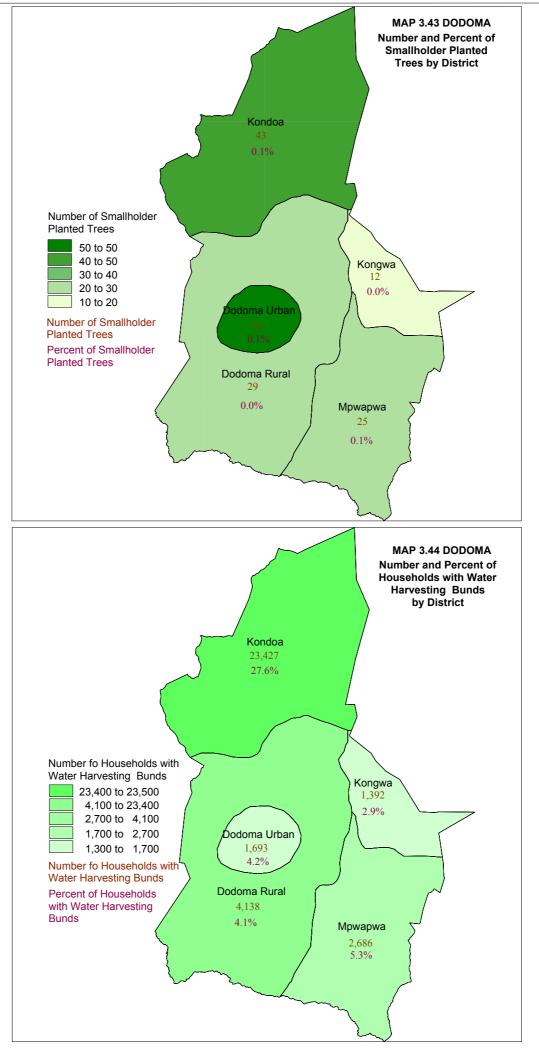

3.118). The main purpose of planting trees is for shade (42.5%). This is followed by planks/timber (29.5%), wood for fuel (15.8%), medicinal (3.8%), poles (3.7%) and charcoal (0.3%) (Chart 3.119).

3.11 Irrigation and Erosion Control Facilities

Erosion control and water harvesting facilities are grouped together as they normally have dual purposes of reducing erosion and increasing the amount of water available for crop production. The number of

agricultural households that had soil erosion and water harvesting facilities on their farms in Dodoma region was 33,336 which represent 10 percent of the total number of agricultural households in the region (Chart 3.120).

The proportion of households with soil erosion control and water harvesting facilities was highest in Kondoa district (28%) followed by Mpwapwa (5%), Dodoma Urban (4%), Dodoma Rural (4%) and Kongwa (3%), (Chart 3.121 and Map 3.44). Erosion Control Bunds accounted for 63.0 percent of the total number of structures in Dodoma region, followed by water harvesting bunds (18.3%), tree belts (6.0%), drainage ditches (5.4%), terraces (4.8%), gabions/sandbags (1.8%), vetiver grass (0.6%) and dams (0.1%) (Chart 3.122).

Erosion control by bunds and tree belts, together had 156,646 structures. This represented 87.3 percent of the total structures in the region. The remaining 12.7 percentages were shared among the rest of the erosion control methods mentioned above.

Kondoa district had the largest number of erosion control

structures in Dodoma region with 96,819 structures (54 percent of the total erosion structures in the region).

3.12.1.1 Cattle Population

The number of indigenous cattle in Dodoma region was 1,025,388 (99.4 % of the total number of cattle in the region), 4,645 cattle (0.5%) were dairy breeds and 1,856 cattle (0.2%) were beef breeds.

The census results show that 63,037 agricultural households in the region (19.5% of total agricultural households) kept about 1 million cattle. This was equivalent to an average of 16

Chart 3.123 Total Number of Cattle ('000') by District

heads of cattle per cattle-keeping-household. The district with the largest number of cattle was Dodoma Rural with 454,826

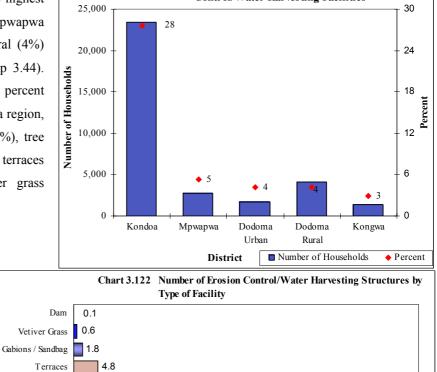

Chart 3.121 Number of Households with Frosion

63.0

120.000

100.000

cattle (44 % of the total cattle in the region). This was followed by Kondoa (204,317 cattle, 20%), Kongwa (171,669 cattle, 17%) and Dodoma Urban (104,918 cattle, 10%). Mpwapwa district had the smallest number of cattle in the region (96,168 cattle, 9%) (Chart 3.123 and Map 3 45). However, Kongwa district had the highest density (135 head per km) (Map 3.46).

Although Dodoma Rural district had the largest number of cattle in the region, most of it was indigenous. The number of dairy cattle was very small and there were no beef cattle in the district. Kongwa district had the largest numbers of diary and beef cattle in the region. In general, the number of beef and dairy cattle in the region was insignificant (Chart 3.124).

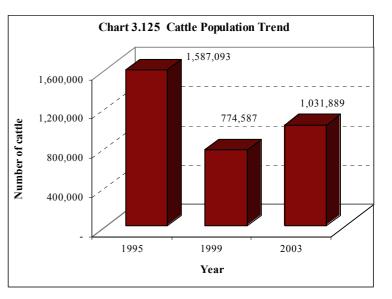

3.12.1.2 Herd Size

Thirty two percent of the cattle-rearing households in Dodoma region had herds of size 1-5 cattle with an average of three cattle per household. Herd sizes of 6-15 accounted for about 42 percent of all cattle-rearing households and 25 percent of all cattle in the region. Only 7 percent of the cattle rearing households had herd sizes of 31- 100 cattle. About 91 percent of total cattle rearing households had herds of size 1-30 cattle and owned 52 percent of total cattle in the region, resulting in an average of 10 cattle per cattle rearing household. There were about 461 households with a herd size of more than 151 cattle each (138,212 cattle in total) resulting in an average of 300 cattle per household.

3.12.1.3 Cattle Population Trend

Cattle population in Dodoma decreased during the period of eight years from 1,587,093 in 1995 to 1,031,889 cattle in 2003. This trend depicts an overall annual negative growth rate of -5.2 percent (Chart 3.125).

The greatest decrease occurred over a four years from 1995 to 1999 at the rate of -16.4 percent whereby the number dropped from 1,587,093 to 774,587. However, the number of cattle increased slightly between 1999 and 2003 to 1,031,889 at an annual rate of 7.4 percent.

3.12.1.4 Improved Cattle Breeds

The total number of improved cattle in Dodoma region was 6,501 (4,645 improved diary and 1,856 improved beef). The diary cattle constituted 0.3 percent of the total cattle and 35.5 percent of improved cattle in the region. The number of beef cattle in the region constituted 65.5 percent of the total number of the improved cattle and 0.5 percent of the total cattle. The total number of improved cattle in Dodoma region was 8,288 in 1995 (2,944 dairy and 5,344 improved beef). The number decreased from 8,288 in 1995 to 6,501 in 2003 at an annual rate of -3 percent. From the year 1995 to 1999 the number of

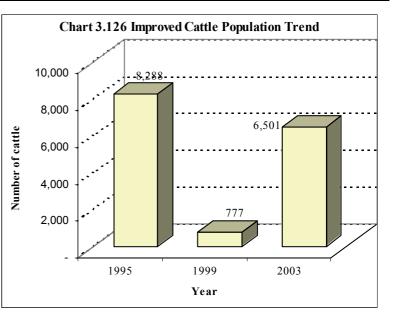

improved cattle decreased from 8,288 to 777 (an annual decrease rate of -44.7). The improved cattle population increased sharply from 777 in 1999 to 6,501 at an annual rate of 70.1. (Chart.126).

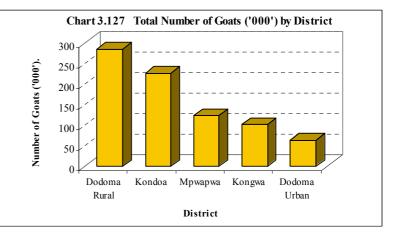

3.12.2. Goat Production

Goat rearing was the second most important livestock keeping activity in the region. In terms of total number of goats on the Mainland, Dodoma region ranked fifth out of the 21 regions with 6.8 percent of the total goats on the Mainland.

3.12.2.1 Goat Population

The number of goat-rearing households in Dodoma region was 63,964 (19.7% of all agricultural households in the region) with a total of 791,481 goats giving an average of 13 head of goats per goat-rearing household. Dodoma Rural disrict had the largest number of goats (284,299 goats, 35.6% of all goats in the region), followed by Kondoa (226,010 goats, 28.3%), Mpwapwa (123,282 goats, 15.5%), Kongwa (100,648 goats, 12.6%) and

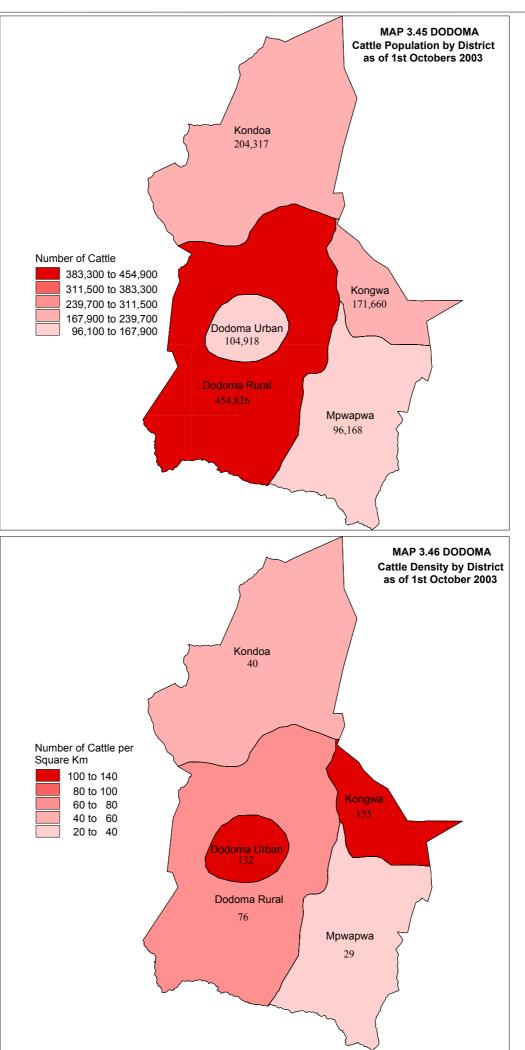

Dodoma Urban (63,243 goats, 7.9%).(Chart 3.127 and Map 3.47). However, Dodoma Urban district had the highest density (80 head per km²) (Map 3.48).

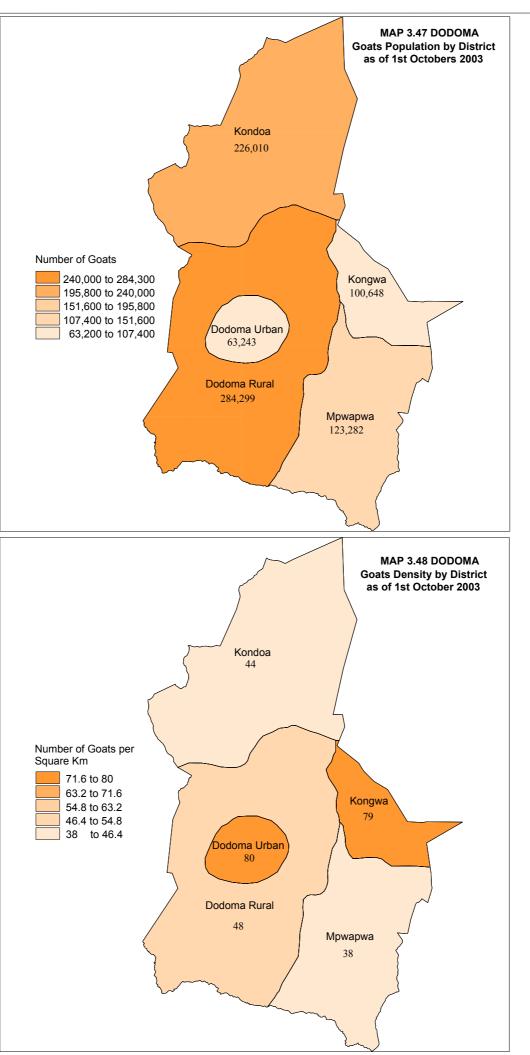

3.12.2.2 Goat Herd Size

Twenty five percent of the goat-rearing households had herd size of 1-4 goats with an average of 3 goats per goat rearing household. Seventy three percent of total goat-rearing households had herd size of 1-14 goats and owned 39 percent of the total goats in the region resulting in an average of 7 goats per goat-rearing households. The region had 2,196 households (3.0%) with herd sizes of 40 or more goats each (156,462 goats in total), resulting in an average of 70 goats per household.

3.12.2.3 Goat Breeds

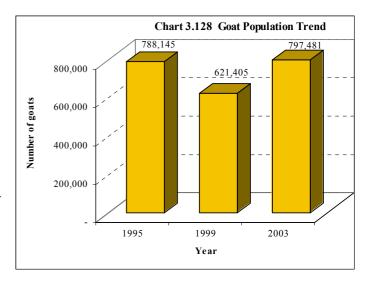

In Dodoma region, goat husbandry in the region was dominated by the indigenous breeds that constituted 99 percent of the total goats in the region. Improved goats for meat and diary goats accounted for 0.2 and 0.8 percent of total goats respectively.

3.12.2.4 Goat Population Trend

The overall annual growth rate of goat population from 1995 to 2003 was 0.15 percent. This positive trend implies eight years of population increase from 788,145 in 1995 to 797,481 in 2003. The number of goats decreased from 788,145 in 1995 to 621,405 in 1999 at an estimated annual rate of -5.8 percent. From 1999 to 2003, the goat population increased at an annual rate of 6.4 percent (Chart 128).

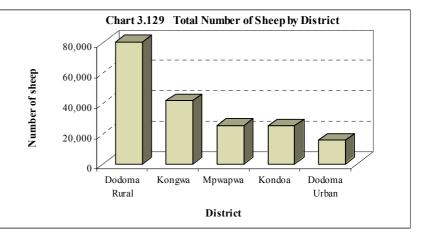

3.12.3. Sheep Production

Sheep rearing was the third most important livestock keeping activity in Dodoma region after cattle and goats. The region ranked ninth out of 21 Mainland regions and had 5 percent of all sheep on Tanzania Mainland.

3.12.3.1 Sheep Population

The number of sheep-rearing households was 23,680 (7.3% of all agricultural households in Dodoma region) rearing 187,244 sheep, giving an average of 8 heads of sheep per sheep-rearing household. The district with the largest number of sheep was Dodoma Rural with 79,877 sheep (43% of total sheep in Dodoma region), followed by Kongwa

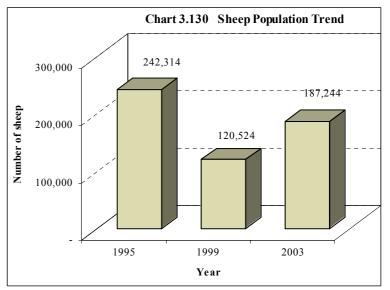

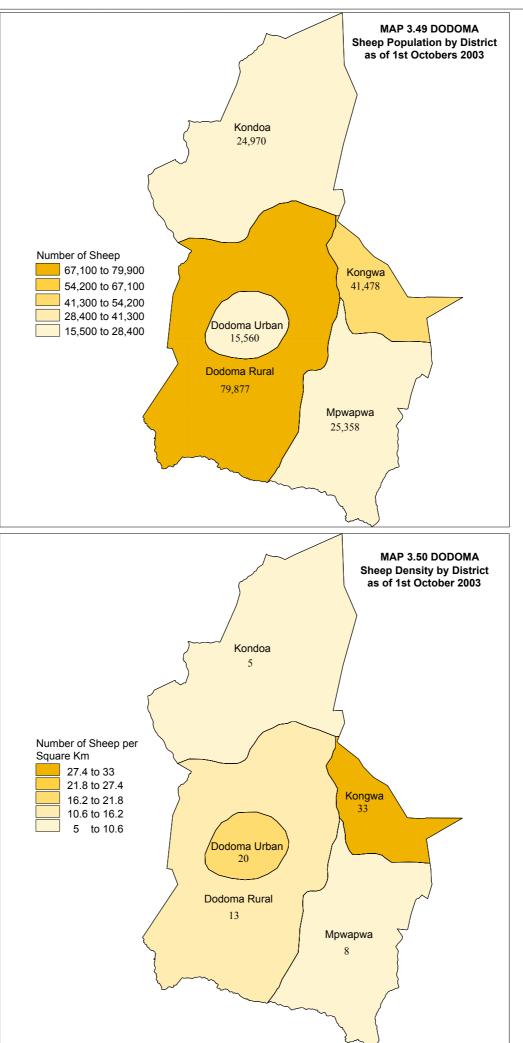

(41,478 sheep, 22%), Mpwapwa (25,358 sheep, 14%) and Kondoa (24,970 sheep, 13%). Dodoma Urban District had the smallest number of sheep in the region (15,560 sheep, 8%) (Chart 3.129 and Map 3.49). However, Kongwa district had the highest density (33 head per km²) (Map 3.50)

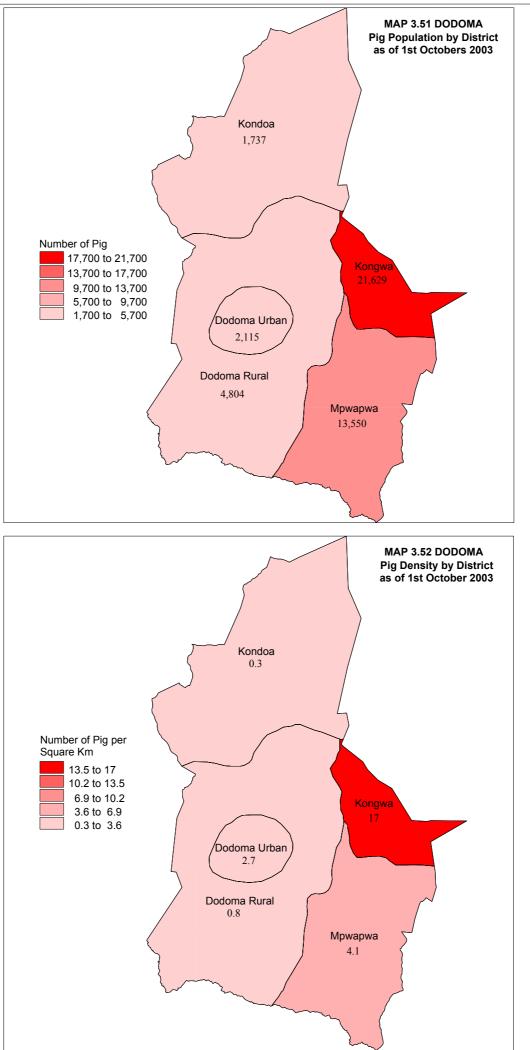

Sheep rearing was dominated by indigenous breeds that constituted 99.5 percent of all sheep kept in the region. Only 0.5 percent of the total sheep in the region were improved breeds.

3.12.3.2 Sheep Population Trend

The overall annual growth rate of the sheep population for the eight year period from 1995 to 2003 is estimated at -4.9 percent. The population decreased at an annual rate of -23.2 percent from 246,314 in 1995 to 120,524 in 1999. From 1999 to 2003, sheep population increased at an annual rate of 17.7 percent (Chart 3.130).

Tanzania Agriculture Sample Census

3.12.4. Pig Production

Pigs are the least important livestock in the region after cattle, goats and sheep. The region ranks 9th out of 21 Mainland regions and has 4 percent of the Mainland total pigs.

The number of pig-rearing agricultural households in Dodoma region was 14,859 (4% of the total agricultural households in the region) rearing 43,835 pigs. This gives an average of 3 pigs per pig-rearing household. The district with the largest number of pigs was Kongwa with 21,629 pigs (49.3% of the total pig population in the region), followed by Mpwapwa (13,550 pigs, 30.9%), Dodoma Rural (2,115 pigs, 4.8%) and Kondoa (1,737 pigs, 4.0%) (Chart 3.131 and Map 3.51). However, Kongwa district had the highest density (17 head per km²) (Map 3.52).

3.12.4.1 Pig Population Trend

The overall annual growth rate of the pig population for the eight years period from 1995 to 2003 was 4.2 percent. During this period the population grew from 31,464 to 43,835. The pig population decreased from 31,464 in 1995 to 12,725, in 1999 at a rate of -20.25 percent after which it increased to 43,835 in 2003 at an annual rate of increase of 36.2 (Chart 3.132).

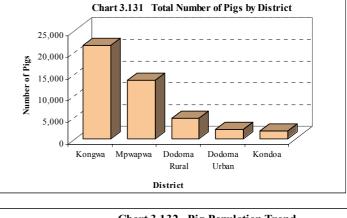

3.12.5 Chicken Production

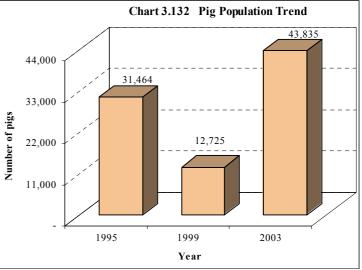

The poultry sector in Dodoma region was dominated by chicken production. The region contributed 5.5 percent to the total chicken population on Tanzania Mainland.

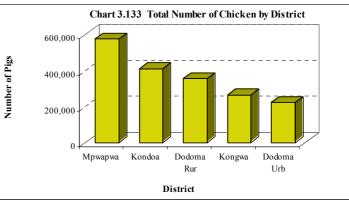

3.12.5.1 Chicken Population

The number of households keeping chickens was 139,992 raising about 1,825,867 chickens. This gives an average of 13 chickens per chickenrearing household. In terms of total number of chickens in the country, Dodoma region was ranked 8 out of the 21 Mainland regions.

The District with largest number of chickens was Mpwapwa with 575,225 chickens (31.5% of the total chickens in the region) followed by Kondoa (409,515 chickens, 22.4%), Dodoma Rural (354,534 chickens, 19.4%) and Kongwa (264,470

RESULTS AND ANALYSIS

chickens, 14.5%). Dodoma Urban district had the smallest number of chickens (222,123 chickens, 12.2%) (Chart 3.133 and Map 53). However, Dodoma Urban district had the highest density (280 chickens per km²) (Map 3.54).

2,000,000

Number of Chicken

3.12.5.2 Chicken Population Trend

The overall annual chicken population growth rate during the eight-year period from 1995 to 2003 was 4.9 percent. The population decreased at a rate of -11.5 percent from 1995 to 1999 after which it increased at an annual rate of increase of 24.4 percent for the four year period from 1999 to 2003 (Chart 3.134).

Eighty nine percent of all chicken in Dodoma region were of indigenous breed. The dominance of indigenous breed makes the population trend

for the indigenous chicken more-or-less the same as that of the total chickens in the region.

3.12.5.3 Chicken Flock Size

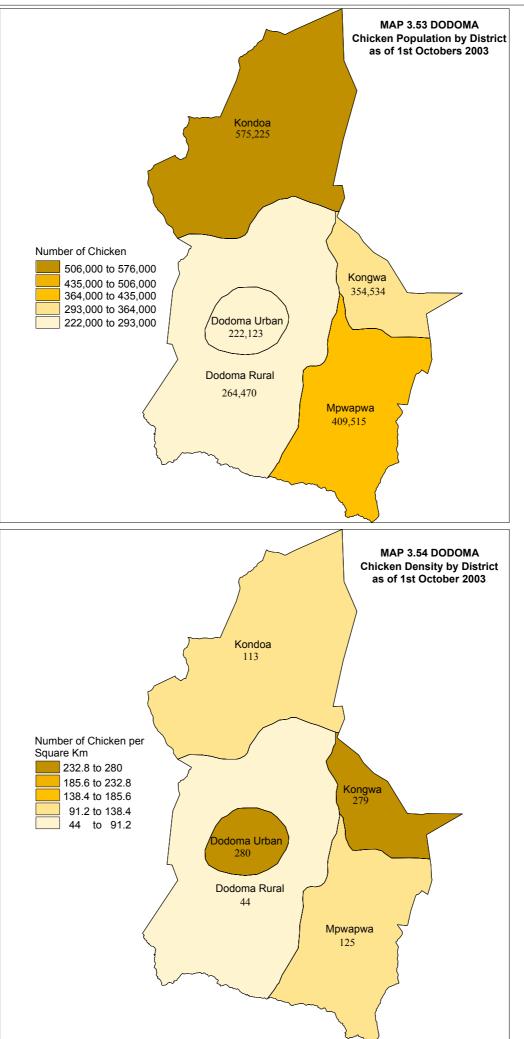

The results indicate that about 87 percent of all chicken-rearing households were keeping 1-19 chickens with an average of 7 chickens per holder. About 13 percent of holders were reported to be keeping the flock size of 20 to 99 chickens with an average of 29 chickens per holder.

Only 1 percent of holders kept the flock sizes of 100 or more chickens at an average of 584 chickens per holder (Table 3.14).

3.12.5.4 Improved Chickens (layers and broilers)

Layers chicken population in Dodoma region increased at an overall annual rate of 44.7 percent for the period of eight years from 6,362 in 1995 to 122,136 in 2003. The largest number of improved chicken was found in Mpwapwa district followed

85

The overall annual growth rate for broilers during the eight-year period from 1995 to 2003 was 21.6 percent during which the improved chicken population grew from 14,556 to 69,652. The annual growth rate for the period of four years from 1999 to 2003 was 91 percent, resulting in an increase in the broiler population from 5,235 to 69,652. The broiler population exhibited a decreasing trend at the rate of -22.6 percent per annum for the period of four years from 14,556 in 1999 to 5,235 in 1999 (Chart 3.136).

3.12.6. Other Livestock

There were 106,227 ducks, 12,075 turkeys and 24,400 donkeys raised by rural agricultural households in Dodoma region.

Table 3.15 indicates the number of livestock kept in each district. The largest number of ducks in the region was found in Mpwapwa district (75.6% of all ducks in the region), followed by Kondoa (15.7%), Kongwa (7.3%) and Dodoma Urban (1.4). There were no ducks in Dodoma Rural district. Turkeys were reported in Kongwa district only (Table 3.15).

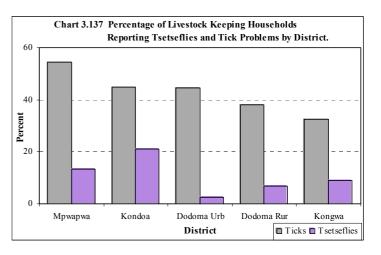

3.12.7 Pests and Parasites Incidences and Control

The census results indicate that 42 percent and 13 percent of the total livestock-keeping households reported to have encountered ticks and tsetsefly problems respectively. Chart 3.137 shows that there is a predominance of tick related diseases over tsetse related diseases. While incidences of tick problems were highest in Mpwapwa district and lowest in Kongwa district, tseflies incidences were highest in Kondoa but lowest in Dodoma Urban district (Chart 3.137 Map 3.55).

 Table 3.15
 Head Number of Other Livestock by Type

 of Livestock and District

of Livestock and District							
	Type of Livestock						
District	Ducks	Turkeys	Donkeys	Other			
Kondoa	16,646	0	4,024	0			
Mpwapwa	80,296	0	7,459	380			
Kongwa	7,790	12,075	1,927	463			
Dodoma Rural	0	0	10,788	230			
Dodoma	1,495	0	202	302			
Urban	1,495	0	202	502			
Total	106,227	12,075	24,400	1,375			

The most practiced method of tick control was spraying with 54 percent of all livestock-rearing households in the region using the method. Other methods used were dipping (12%), smearing (4%) and other traditional methods like hand picking (6%). However, 24 percent of livestock-keeping households did not use any method.

The most common method used to control tsetse flies was spraying which was practiced by 27 percent of livestock-rearing households. This was followed by dipping (13%) and trapping (1%). However, 59 percent of the livestock rearing households did not use any of the three aforementioned methods.

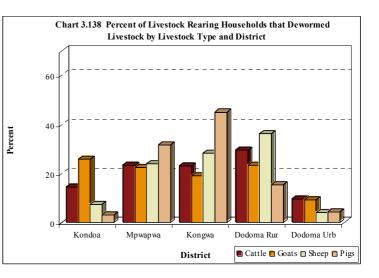

3.12.7.1 Deworming

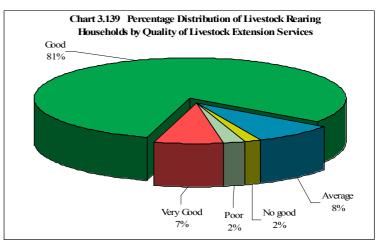

Livestock rearing households that dewormed their animals were 23,935 (27% of the total livestock rearing households in the region). The percentage of cattle keeping households that dewormed cattle was 26 percent, goats (13%), sheep (31%) and pigs (30%). The district with the largest number of households that dewormed cattle was Dodoma Rural (29% of total households that dewormed cattle), followed by Mpwapwa (23%), Kongwa (23%), Kondoa (14%) and Dodoma Urban (10%)(Chart 3.138).

3.12.8. Access to Livestock Services

3.12.8.1 Access to Livestock Extension Services

The total number of households that received livestock advice was 34,318, representing 38 percent of the total livestock-rearing households and 11 percent of the agricultural households in the region. The main livestock extension agent was the Government which provided service to about 22 percent of all households receiving livestock extension services. This was closely followed by NGOs/Development Projects (21%), Cooperatives (19%) and Large Scale Farmers (19%).

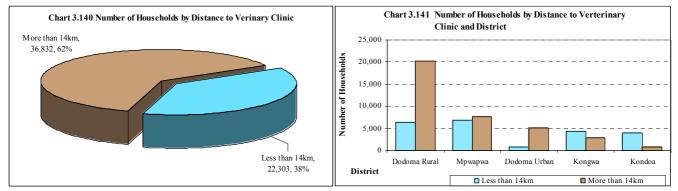

About 81 percent of livestock rearing households described the general quality of livestock extension services as being good, 8 percent said they were average and 7 percent said they were very good. However, 2 percent of the livestock rearing households said the quality was not good and 2 percent described them as poor (Chart 3.139).

3.12.8.2 Access to Veterinary Clinic

About 62 percent of the livestock rearing households accessed the services, at a distance of more than 14 kms. Only 38 percent of them accessed the services within 14 kms from their dwellings (Chart 3.140). The most affected district was Dodoma Rural

with 76 percent of livestock rearing households accessing the

services at a distance of more than 14 kms. Kondoa District was the least affected because about 82 percent of the households

could access the service within a distance of 14 kilometres (Chart 3.141).

3.12.8.3 Access to Village Watering Points/dam

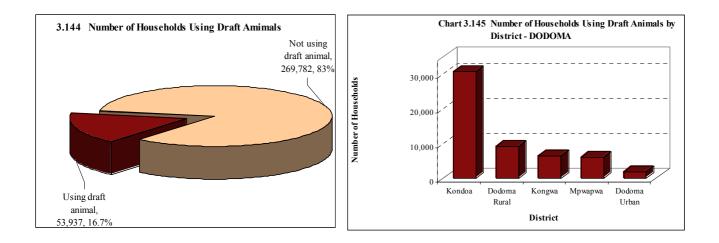

The number of livestock rearing households residing less than 5 kms from the nearest watering point was 31,168 (82% of livestock rearing households in Dodoma region) whilst 4,539 households (12%) resided between 5 and 14 kms. However, 2,169 households (6%) had to travel a distance of 15 kms or more to the nearest watering point (Chart 3.142).

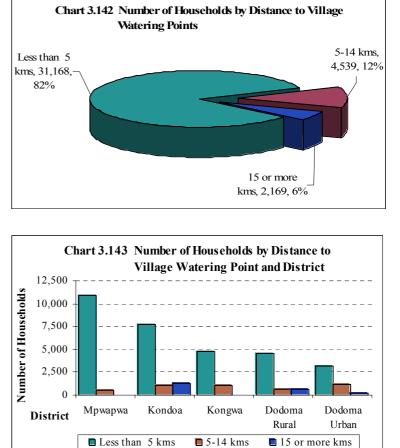

Mpwapwa district had the best livestock water supply with the majority of livestock rearing households residing within 5 kilometres from the nearest watering point. This is followed by Kondoa, Kongwa and Dodoma Rural districts. In Dodoma Urban district, about 31 percent of the livestock rearing households had to travel a distance of 5 or more kilometers to the nearest watering point (Chart 3.143).

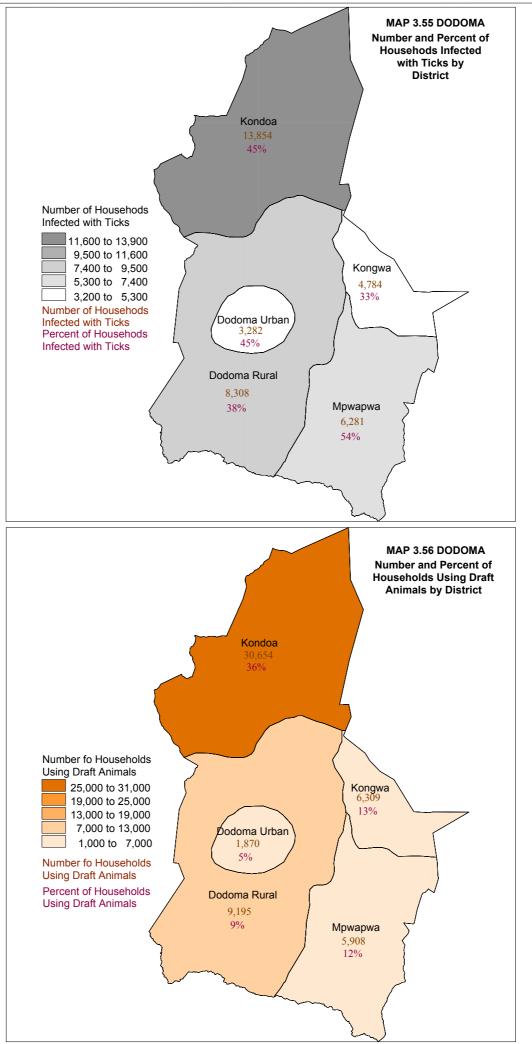

3.12.9. Animal Contribution to Crop Production

3.12.9.1 Use of Draft Power

Use of draft animals to cultivate land in Dodoma region is moderate with 53,937 households (17% of the total households in the region) using them (Chart 3.144). The region had 83,989 oxen that were used to cultivate 101,607 hectares of land. This represents only 3.7 percent of the total oxen found on the Mainland. The largest area cultivated using oxen was found in Kondoa district 47.5% (48, 222)of the total cultivated ha area using oxen) (Map 3.56).

3.12.9.2 Use of Farm Yard Manure

The number of households using organic fertiliser in Dodoma region was 82,687 (26% of total crop growing households in the region) (Chart 3.146). The total area applied with organic fertiliser was 92,594 ha of which 88,456 hectares (95.5% of the total area applied with inorganic fertilizer was applied with farm yard manure or 14 percent of the area planted with annual crops and vegetables in Dodoma region)

The largest area applied with farm yard manure was found in Kondoa district with 26,378 hectares (29.8% of the total area applied with farm yard manure) followed by Dodoma Rural (24,707 ha, 27.9%), Dodoma Urban (13,446 ha, 15.2%), Kongwa (12,065 ha, 13.6%) and Mpwapwa (11,860 ha, 13.4%) (Chart 3.147 and Map 3.57).

3.12.9.4 Use of Compost

Only 4,138 ha (4.5% of the area of organic fertiliser application) was applied with compost. The largest area applied with compost was found in Kongwa district with 2,666 hectares (64.4% of the total area

applied with compost in the region) followed by Kondoa (1,237 ha, 29.9%), Mpwapwa (105 ha, 2.5%), Dodoma Urban (85 ha, 2.1%) and Dodoma Rural (45 ha, 1.1%) (Chart 3.147 and Map 3.58).

3.12.10 Fish Farming

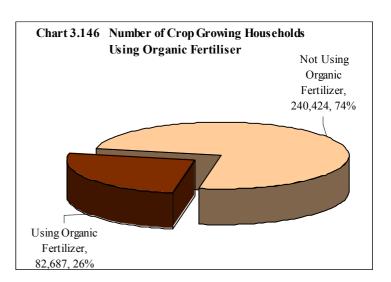

The number of households involved in fish farming in Dodoma region was only 129, representing 0.04 percent of the total agricultural households in the region (Chart 3.148).

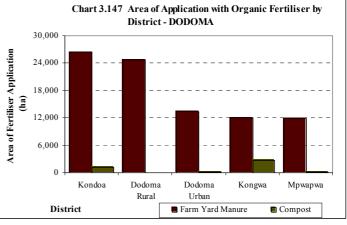

Mpwapwa was the only district in the region practicing fish farming. (Chart 3.149 and Map 3.59).

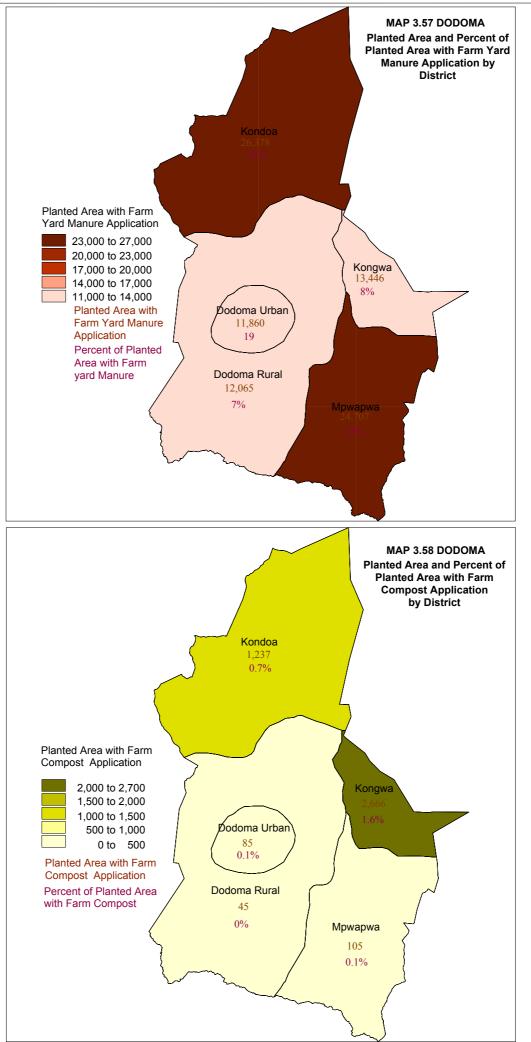

Non governmental organizations and/or projects were the only supplier of fingerings. All fish farming households in the region used the dug-out-pond system and the only fish specie planted was tilapia. The number of fish harvested in Dodoma region was 6,985, all of which were tilapia. All fish farming households did not sell their fish.

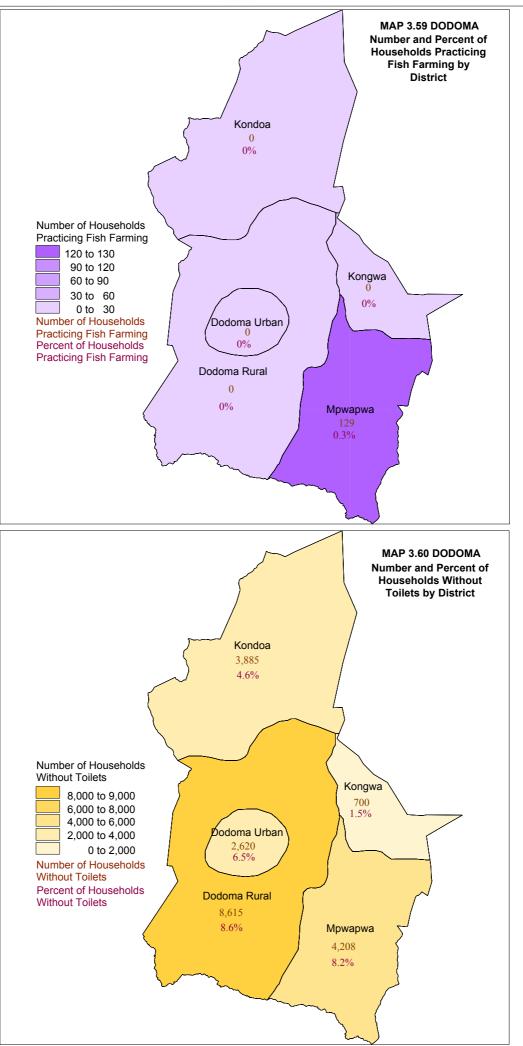

3.12.11 Access to Infrastructure and Other Services

The census results indicate that among the evaluated services, regional capital was a service located very far from most of the household's dwellings than any other service. It was located at an average distance of 113 kilometers from the agricultural household's dwellings. Other services and their respective average distances from the dwellings were tarmac road (86 km), tertiary market (55 km), hospital (49 km), secondary school (20 km), secondary market (12 km), primary markets (10 km), health clinic (7 km), all weather road (7 km), primary school (3 km) and feeder road (3 km) (Table 3.15).

		Mean Distance to									
District	Secondary Schools	Primar y School s	All weathe r roads	Feeder Roads	Hospitals	Health Clinics	Regional Capital	Primary Markets	Secondary Market	Tertiary Market	Tarmac Roads
Kondoa	20.0	2.5	10.9	3.2	52.1	6.1	187.6	9.7	9.0	62.3	170.4
Mpwapwa	28.2	5.3	5.9	2.1	53.0	9.3	159.2	9.4	15.3	59.0	99.4
Kongwa	17.7	3.4	1.0	2.4	38.7	6.5	102.7	7.7	10.9	33.1	20.2
Dodoma Rural	21.0	3.0	10.1	2.5	58.9	7.8	66.4	9.5	12.5	65.6	64.2
Dodoma Urban	13.1	2.2	2.5	3.4	26.9	7.7	27.5	11.5	11.5	30.5	21.0
Total	20.4	3.2	7.4	2.7	49.3	7.4	113.2	9.5	11.6	54.6	85.8

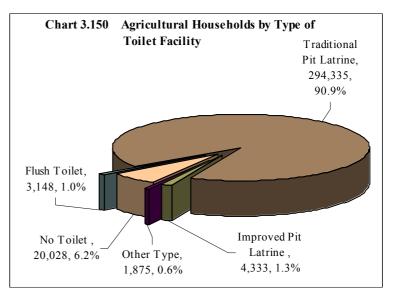

Forty seven percent of the agricultural households reported the infrastructure and services to be "good", 20 percent reported them to be "poor" and 2 percent ranked the service as being 'no good'. Only 9 percent of the agricultural households reported the available infrastructures and services as 'very good' whilst 15 percent of the agricultural households reported them to be "average".

3.13 POVERTY INDICATORS

The agricultural census collected data on poverty for the purpose of providing a base for tracking progress in poverty reduction strategies undertaken by the government.

3.13.1 Type of Toilets

A large number of rural agricultural households in Dodoma region use traditional pit latrines (294,335 households, 90.9% of all rural agricultural households) 4,333 households (1.3%) use improved pit latrine and 3,148 households (1.0%) use flush toilets. The

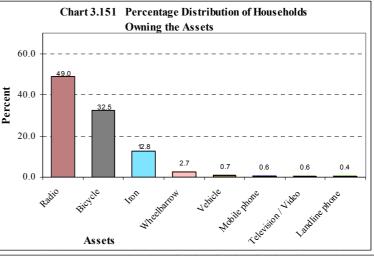

remaining 1,875 household (0.6%) use other toilets facilities. However, 20,028 households (6.2%) in the region had no toilet facilities (Chart 3.150).

The highest percent of households without toilet facilities in the region was found in Dodoma Rural (43% of the total agricultural households in the region), followed by Kongwa district (3.5%), Mpwapwa (21.0%), Kondoa (19.4%) and Dodoma Urban (13.1%) Map 3.60).

3.13.2 Household's Assets

Radios are owned by most rural agricultural households in Dodoma region with 158,476 households (49.0% of the agriculture households in the region) owning the asset, followed by bicycle (105,196 households, 32.5%), iron 12.8%), (41,379 households, wheelbarrow (8,797 2.7%), vehicle households, (2,418)households, 0.7%), mobile phone (1,849

households, 0.6%), television/video (1,835 households, 0.6%) and landline phone (1,340 households, 0.4%) (Chart 3.151).

3.13.3 Sources of Lighting Energy

Wick lamp is the most common source of lighting energy in the region with 72 percent of the total rural households using this source of energy, followed by hurricane lamp (16%), firewood (9%), pressure lamp (2%), main electricity (0.6%), candle (0.4%), gas (biogas) (0.2%) and solar (0.1%) (Chart 3.152).

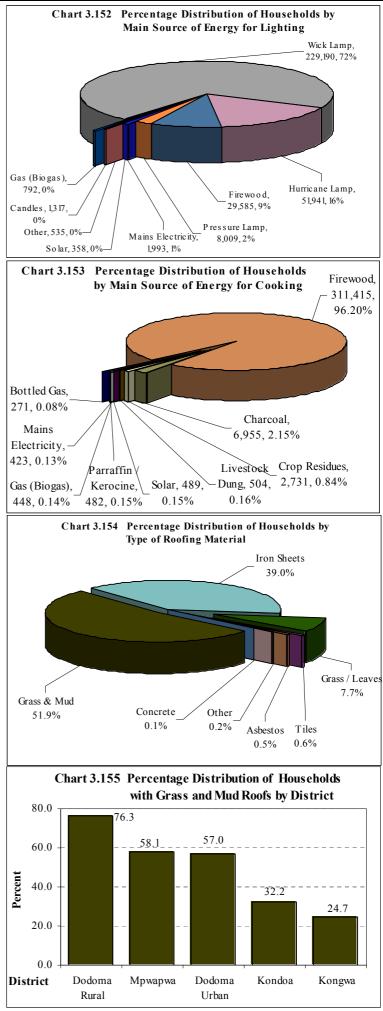

3.13.4 Sources of Energy for Cooking

The most prevalent source of energy for cooking was firewood, which was used by 96.20 percent of all rural agricultural households in Dodoma region. This is followed by charcoal (2.15%) and crop residues (0.84%). The rest of energy sources accounted for 0.81 percent. (livestock dung (0.16%), solar (0.15%), paraffin/kerosene (0.15%), biogas (0.14%), main electricity (0.13%) and bottled gas (0.08%)) (Chart 3.153).

3.13.5 Roofing Materials

The most common material used for roofing of the main dwelling in Dodoma region was grass and mud and it was used by 51.9 percent of the rural agricultural households. This was followed by iron sheets (39.0%), grass/leaves (7.7%), tiles (0.6%), asbestos (0.5%), concrete (0.1%) and others (0.2%) (Chart 3.154).

Dodoma Rural district had the highest percentage of households with grass/mud roofing material (76.3%) and was followed by Mpwapwa district (58.1%), Dodoma Urban (57.0%), Kondoa (32.2%) and Kongwa (24.7%) (Chart 3.155 and Map 3.61).

3.13.6 Access to Drinking Water

The main source of drinking water for rural agricultural households in Dodoma region was piped water (36% of households use piped water during the wet season and 50% of the households during the dry season). This is followed by unprotected wells (28% of households during the wet season and 28% in the dry season), unprotected spring (8.6% of households in the wet season and 9.1% during the dry season) and protected wells (8.2% of households using the source in the wet season and 8.8% in the dry season).

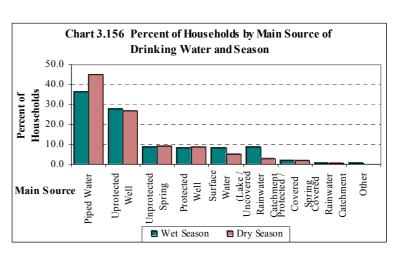

Other sources of drinking water and their respective percentages of households using the source for drinking water during wet and dry season are surface water (8.2% wet season, 4.8 dry season), uncovered rainwater catchment (8.4% wet season, 2.9% dry season), protected spring (1.9% wet season, 2.0% dry season), covered rainwater catchment (0.4% in both seasons) and other sources (0.4% wet season, 0.1 dry season) (Chart 3.156).

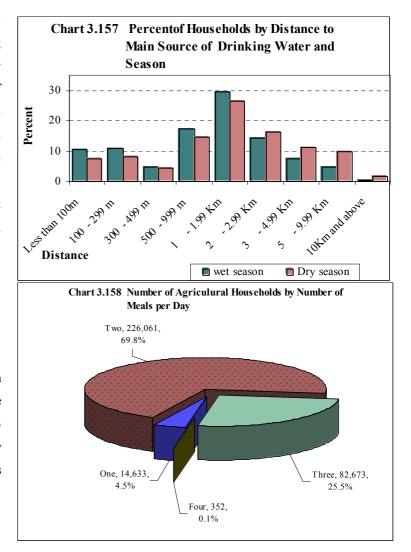

About 44 percent of the rural agricultural households in Dodoma region obtained drinking water within a distance of less than one kilometer during the wet season compared to 35 percent of the households during the dry season. However, 56 percent of the agricultural households obtained drinking water from a distance of one or more kilometers during wet season compared to 65 percent of households in the dry season. The most common distance from the source of drinking water was between 1 and 2 km (Chart 3.157).

3.13.7 Food Consumption Pattern

3.13.7.1 Number of Meals per Day

The majority of households in Dodoma region normally have 2 meals per day (69.8 percent of the households in the region). This is followed by 3 meals per day (25.5 percent) and 1 meal per day (4.5 percent). Only 0.1 percent of the households have 4 meals per day (Chart 3.158).

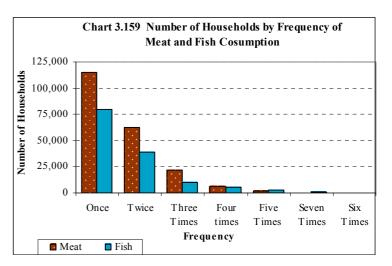

Dodoma Urban district had the highest percent of households having one meal per day whilst Kondoa had the highest percent of households taking 3 meals per day (Table 3.17 and Map 3.62).

				Number of	of meals per	r day			
District	One	%	Two	%	Three	%	Four	%	Total
Kondoa	724	0.9	37,133	43.8	46,899	55.3	0	0.0	84,756
Mpwapwa	1,532	3.0	41,841	82.0	7,423	14.5	259	0.5	51,055
Kongwa	352	0.7	34,341	72.7	12,545	26.6	0	0.0	47,238
Dodoma Rur	6,823	6.8	83,667	83.3	9,991	9.9	0	0.0	100,482
Dodoma Urb	5,203	12.9	29,078	72.4	5,815	14.5	94	0.2	40,189
Total	14,633	4.5	226,061	69.8	82,673	25.5	352	0.1	323,719

Chart 3.17: Number of Households by Number of Meals Taken per Day and District

3.13.7.2 Meat Consumption Frequency

The number of agricultural households that consumed meat during the week preceding the census was 208,654 (64% of the agricultural households in Dodoma region). Of these households 115,314 consumed meat once during the week (55.3 % of those who consumed consuming meat). This was followed by those who had meat twice during the week (30.0%). Very few households had meat four times or more during the respective week. About 35.5 percent of the agricultural households in Dodoma

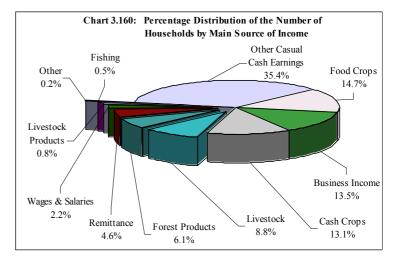

region did not eat meat during the week preceding the census (Chart 3.159 and Map 3.63).

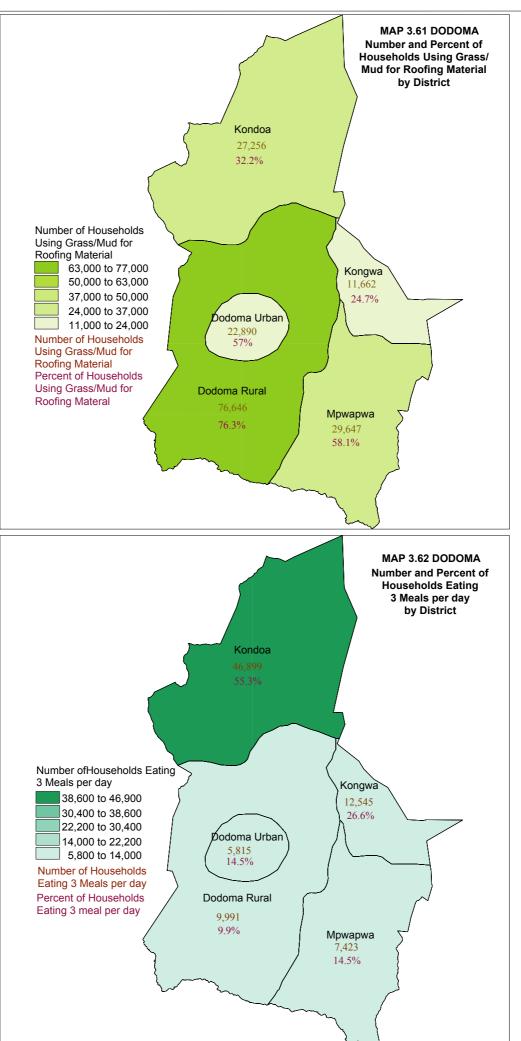

3.13.7.3 Fish Consumption Frequencies

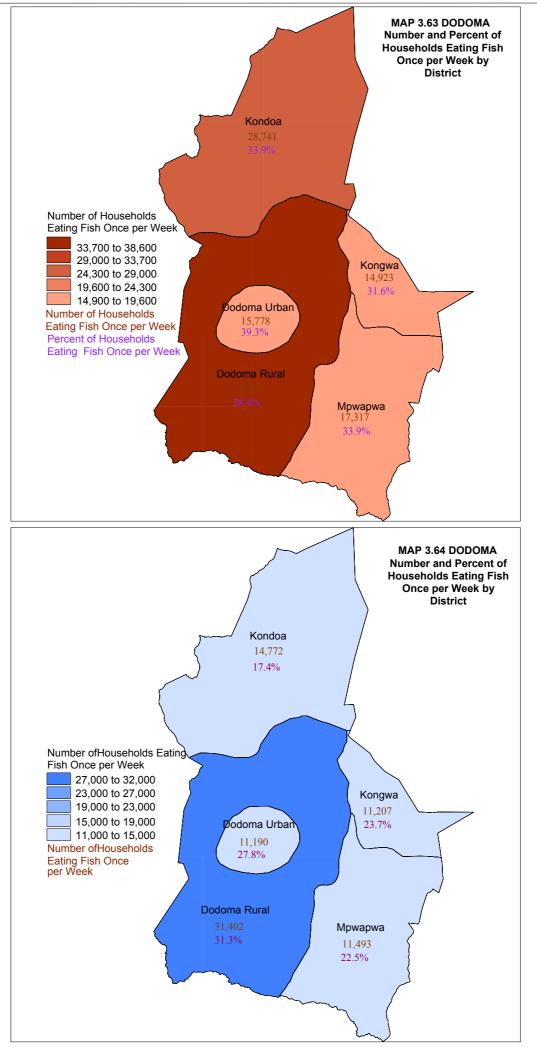

The number of agricultural households that consumed fish during the week preceding the census was 138,561(42.8% of the total agricultural households in Dodoma region). Of these households 38,764 households consumed fish twice during the week (28.0 % of those who consumed fish in the region). This was followed by those who had fish three times (7.4%). In general, the number of households that consumed fish twice or more during the week in Dodoma region was 58,497 (42.2% of the agricultural households that ate fish in the region during the respective period). About 57.2 percent of the agricultural households in Dodoma region during the week preceding the census (Chart 3.160 and Map 3.64).

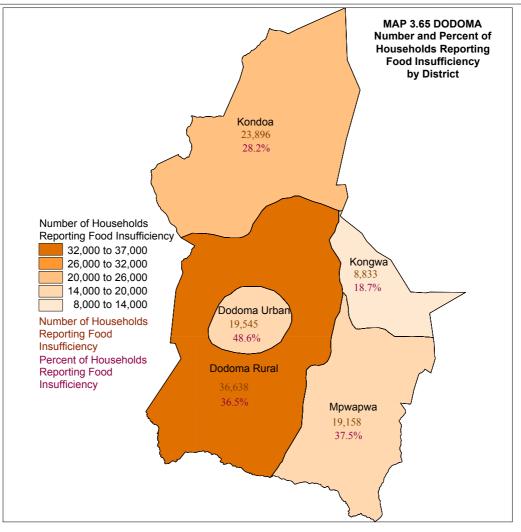

3.13.8 Food Security

In Dodoma region, 110,205 households (34% of the total agricultural households in the region) said they rarely experienced problems in satisfying the household food requirement. However, 23,088 (7.1%) said they sometimes experience problems, 17 percent often experienced problems and 9.2 percent always had problems in satisfying the household food requirement. About 32.6 percent of the agricultural households said they did not experience any food sufficiency problems (Map 3.65).

The main cash income of the households in Dodoma region was from other casual earnings (35.4 percent of smallholder households), followed by selling of food crops (14.7%), businesses (13.5%), selling of cash crops (13.1%) and sale of livestock (8.8%). Other sources of income include sale of forest product (6.1%), cash remittance (4.6%), wages and salaries (2.2%), sale of livestock products (0.8%), fishing (0.5%) and other unspecified sources (0.9%) (Chart 3.160).

PART IV: DODOMA PROFILES

4.1 Region Profile

Dodoma has the second largest land area under cultivation (750,000 ha) with over two thirds under annual crops and most of the remaining under annual mixed crops. Very little permanent crops are grown by smallholders in the region. Almost all land area allocated to smallholders in the region is utilised indicating the possibility of land pressure and 37 percent of smallholders reported that they have insufficient land. Whilst Dodoma does not have a Dry Season, it has the second largest planted area of maize in the country and one of the largest areas planted per household, however the yield during the census year was amongst the lowest in the country. Paddy is not important in the region, however it has the third largest planted area of sorghum in the country. The region as a whole is not important for cassava or bean production however, the households that do grow cassava and beans grow more than households in most other regions. Dodoma has the largest planted area and one of the highest productions of groundnuts in the country. The region is not important for smallholder vegetable production and annual cash crops, however it has the second largest planted area of pigeon peas in the country.

Dodoma has one of the smallest areas of irrigation in the country. The region has the highest percent of land clearing by burning in the country and the largest area of land cultivated by hand. Land cultivated by oxen is moderate and, although small, has one of the largest areas cultivated by tractor. Compared to other regions, it has the second largest area without fertiliser in the country. Approximately one sixth of the planted area was applied with farm yard manure. Chemical inputs are used in very small quantities.

Approximately 70 percent of stored crops are in sacks or open drums, with the remainder in traditional cribs. Most processing is done by neighbours' machines and the region has the fifth largest number of households selling processed produce in the country. Smallholders in Dodoma have above average access to extension advice. The most common implement is the hand hoe although some oxen and other implements are also available.

Dodoma has a small amount of trees planted by smallholders and has a comparatively moderate amount of erosion control facilities.

4.2 DISTRICT PROFILES

The following district profiles highlight the characteristics of each district and compares them in relation to Population, Main crop and livestock production and productivity, access to services and resources and levels of poverty.

4.2.1 Kondoa

Kondoa district has the second largest number of households in the region and it has one of the highest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in livestock keeping only, followed by crop and livestock production. It has a very small number of crops only households and no pastoralists were found in the district.

The most important livelihood activity for smallholder households in Kondoa district is Annual Crop Farming, followed by off farm income and forestry products. However, the district has the lowest percent of households with no off-farm activities and the second lowest percent of households with more than one member with off-farm income. Compared to other districts in the region, Kondoa has a relatively high percent of female headed households (22.7%) and it has the second highest average age of the household head. The district has the highest average household size (4.9 members per household) in the region. Kondoa has the highest literacy rate among smallholder households and this is reflected by the concomitant relatively high

level of school attendance in the district. The district has the second highest literacy rate for the heads of household in the region.

It has the largest utilized land area per household (4.0ha) and the allocated area is almost fully utilized (94% land utilization) indicating an impending high level of land pressure. The district has a third largest total planted area as well as area per household (1.8 ha).

The district is the second largest maize producer in the region with a planted area of 79,653 and the planted area per household is the third largest in the region. Burlush millet production is not important with a planted area of only 6 percent of the total area planted in the region. The district is the third largest producer of sorghum and the highest producer of finger millet in the region. Cassava production is moderate accounting for 15 percent of the quantity harvested in the region. The district is the second among the two Irish potato producing districts in the region (59 ha). The production of beans in Kondoa is much higher than in other districts in the region with a planted area of 4,774ha. Oilseed crops are not important in Kondoa and has the least area planted with groundnuts in the region. Vegetable production is important in the district. It has the largest planted area with onions and second largest area of tomato and amaranths.

Kondoa has a largest planted area with permanent crops which is dominated by pigeon peas (17,199 ha). Other permanent crops are grown in very small quantities.

As with other districts in the region, most land clearing and preparation is done by hand, however it has the largest area of land prepared using oxen.

The use of inputs in the region is very small, however district differences exist. Kondoa has the moderate planted area with improved seed in Dodoma. The district has the second largest planted area with fertilisers (farm yard manure, compost and inorganic fertiliser), however most of this is farm yard manure. Compared to other districts in the region, Kondoa district has a lowest level of insecticide use. The use of fungicides was moderate and has a lowest level of herbicide use compared to other districts. It has the second largest area with irrigation compared to other districts with 2,497 ha of irrigated land. The most common source of water for irrigation is from wells. Flood and bucket are the most common means of irrigation water application and a very small amount of water hose irrigation is used.

The proportion of households storing crops in Kondoa district is the highest in the region and the most common method of crop storage in the district is in sacks and/or open drums. The district has the largest number of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. The highest percent of households processing crops in Dodoma region is found in Kondoa district and more than 70 percent of households are processing on farm using neighbor machines. The district also has the second highest percent of households selling processed crops to traders on farm than other districts and no sales are to secondary markets, marketing cooperatives and large scale farms. Access to credit in the district is very small, however Kondoa district has the second highest proportion of household with access to credit. The main sources of credit in the district are family friends and relatives and religious organisations/NGO projects.

The district has a smallest proportion of households receiving extension services in the region and almost all of this is from the government. The quality of extension services was rated good by the majority of the households.

Tree farming is not important in Kondoa (with 229,983 planted trees) and is mostly eucalyptus with some gravellis. The highest proportion of erosion control and water harvesting structures is found in Kondoa district and is mostly erosion control bunds, however it also has the second highest number of vertiver grass strips and water harvesting bunds than other districts.

The district has the second largest number of cattle and goats in the region and they are almost all indigenous, however it has the second smallest sheep population in the region. It has the smallest number of pigs in the region and the second highest number of chickens dominated by indigenous chicken and no layers. Small numbers of ducks and donkeys are also found in the district. It has the largest number of households reporting tsetse and tick problems in the region and it has a relatively small number of households de-worming livestock. The use of draft animals in the district is the highest in the region and there is no fish farming.

It has amongst the best access to primary schools, health clinics and secondary markets compared to other districts. However, it has one of the worst accesses to all weather roads, regional capital and tarmac roads.

Kondoa district has the second lowest percent of households with no toilet facilities and it has the lowest percent of households owning TV/video. It has the second highest proportion of households using mains electricity in the region. The most common source of energy for lighting is the wick lamp and practically all households use firewood for cooking. The district has relatively small percent of households with grass roofs with 53 percent of households having iron sheets. The most common source of drinking water is from unprotected wells followed with piped water. It has the lowest percent of households having two or one meal per day compared to other districts and the highest percent with 3 meals per day. The district is among the two districts with the highest percent of households that did not eat meat or fish during the week prior to enumeration, however most households seldom had problems with food satisfaction.

4.2.2 Mpwapwa

Mpwapwa is the second district with the least number of households in the region and it is the two districts with lowest percent of households involved in smallholder agriculture in the region. Most smallholders are involved in livestock only, followed by crop production only. No pastoralists are found in the district.

The most important livelihood activity for smallholder households in Mpwapwa district is Annual Crop Farming, followed by Off farm Income. However, the district has the third highest percent of households with no off-farm activities and has the second highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Mpwapwa has a relatively low percent of female headed households (19%) and it has the lowest average age of the household head in the region. The district has the second highest average household size in the region. Mpwapwa has a comparatively high literacy rate among smallholder households and this is reflected by the concomitant relatively high level of school attendance in the region. The literacy rate for the heads of household is also slightly higher than other two districts in the region.

It has the largest utilized land area per household (2.4 ha) and the allocated area is almost fully utilized (94.4% land utilization) indicating an impending high level of land pressure. The district has the second smallest planted area in the region as well as planted area per household (1.01 ha).

Maize production in the district is low compared to other districts in the region with a planted area of 51,352 ha, however the planted area per household is high. Bulrush millet production is less important with a planted area of only 2,748 hectares. The district is a second sorghum producer in the region. Mpwapwa has a largest area planted with cassava, Irish potatoes and beans in the region. Mpwapwa district has the second largest groundnut planted area in Dodoma region with area planted per groundnut growing household of 0.88 ha. Vegetable production is moderately important in the district. It has the third largest planted area with tomatoes and amaranths and second largest area planted with onions. It accounts for 42 percent of the total area planted with onions in the region.

Compared to other districts in the region, Mpwapwa has the third largest planted area with permanent crops which is dominated by bananas (1,458 ha), guava (824 ha) and rubber vine fruits (104 ha). Other permanent crops are either not grown or are grown in very small quantities.

As with other districts in the region, most land clearing and preparation is done by hand and a very of small land preparation is done by oxen.

The use of inputs in the region is very small, however district differences exist. Mpwapwa has the second smallest planted area with improved seed in Dodoma region, however it has the second highest proportion of households using improved seeds. The district has the second lowest planted area with fertilisers (Farm yard manure, compost and inorganic fertiliser), however most of this is farm yard manure. Compared to other districts in the region, Mpwapwa district has low level of insecticide use. The use of fungicides was moderate compared to other districts. It has the second largest area planted applied with herbicides in the region. It has the largest area with irrigation compared to other districts with 1,651 ha of irrigated land. The most common source of water for irrigation is from rivers using gravity. Flood and bucket are the most common means of irrigation water application.

The proportion of households storing crops in Mpwapwa district is moderate and the most common methods of crop storage in the district is in sacks and/or open drum and locally made traditional structures. Mpwapwa district has the second largest proportion of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Mpwapwa is among the districts with the highest percent of households processing crops in Dodoma region and 58 percent of all households are processing using neighbours machine. The district also has the second highest percent of households selling processed crops to neighbours than other districts and no sales are to farmers associations, large scale farms or local market/trade store. Access to credit in the district is relatively small and the main sources are family, friends and relatives and religious organisations/NGO projects.

A comparatively low number of households receive extension services in Mpwapwa district and 94 percent of this is from the government. The quality of extension services was rated "good" by the majority of the households.

The district has the largest number of trees in the region (with 738,104 planted trees) and is mostly eucalyptus, acacia spp and laucena spp. Mpwapwa district has the third highest proportion of erosion control and water harvesting structures in the region and is mostly dams, erosion control bunds and tree belts, however it also has the a number of water harvesting bunds and drainage ditches.

The district has the smallest number of cattle in the region and they are almost all indigenous. Goat and Sheep production is moderate compared to other districts in the region. It has the second largest number of pigs in the region and the largest number of chickens. Some ducks and donkeys are also found in the district. A number of households reported tsetse and tick problems in Mpwapwa district and it has the third largest proportion of households de-worming livestock. The district has moderate number of households using draft animals in the region. Among all districts, fish farming is practiced in Mpwapwa district only.

Compared to other districts, it has the worst access to almost all infrastructure and services except feeder roads and all weather roads.

The percentage of households without toilet facility in Mpwapwa district is 8.2, which is the second highest in the region. It is among the districts with the lowest percent of households owning wheel barrows, bicycles and irons. It has the third highest proportion of households using mains electricity in the region. The most common source of energy for lighting is the wick lamp and practically almost all households use firewood for cooking. The roofing material for most of the households in the district is grass and mud (58%) and iron sheets (28%). The most common source of drinking water is piped water followed by unprotected wells. It is one of the districts with the highest percent of households having two meals per day. The district has one of the highest percent of households that did not eat meat or fish during the week prior to enumeration, however it has the second highest proportion of households who face problems in satisfying household food requirements.

4.2.3 Kongwa

Kongwa district has the lowest number of households in the region and it has a moderate percent of households involved in smallholder agriculture in the region. Most smallholders are involved in livestock keeping only, followed by crop and livestock production. No pastoralists were found in the district.

The most important livelihood activity for smallholder households in Kongwa district is Annual Crop Farming, followed by off-farm income activities. However, the district has the second lowest percent of households with no off-farm activities and the highest percent of households with more than one member with off-farm income. Compared to other districts in the region, Kongwa has the lowest percent of female headed households (16%) and it has the second lowest average age of the household head in the region. The district has the highest average household size (5.3 members per household) in the region. Kongwa has a comparatively low literacy rate among smallholder households and this is reflected by the concomitant relatively low level of school attendance in the region. However, it has the second highest literacy rate for the heads of household in the region.

It has a slightly higher utilized land area per household (4.0ha) than the regional average of 2.4 ha and 94 percent of the allocated area is currently being utilized. The total planted area as well as the area planted per household (1.9 ha) is greater than in other districts in the region.

The district is leading in maize production in the region with a planted area of about 131,930 ha. The highest maize production in the district is attributed by among other factors the highest area planted per maize growing household (2.9ha) in the region. Bulrush millet and sorghum production is not important with a planted area of only 4,971 and 7,740 hectares respectively. The district has the smallest planted area of cassava accounting for 6 percent of the cassava planted area in the region and there is no Irish potato production. The production of beans in Kongwa is much lower than in other districts in the region with a

planted area of 142 ha. Oilseed crops are moderate important in Kongwa with 20 percent of the groundnuts grown in the district. Vegetable production is not important in the district.

Permanent crops are of moderate importance in Kongwa district (11% of the total permanent crop planted area in Dodoma region is found in the district). The most prominent permanent crop in the district pigeon peas (2,468 ha) accounting for 93 percent of the total area planted with permanent crops in the district. Other permanent crops are unimportant in the district with banana (59 ha), guava (47 ha), mango (23 ha) and lime/lemons (23 ha) having only 59, 47, 23 and 23 hectares respectively. Other permanent crops are either not grown or are grown in very small quantities.

As with other districts in the region, most land clearing and preparation is done by hand and small land preparation is done by oxen. The district has the highest percentage of household using tractors for ploughing in the region.

The use of inputs in the region is very small, however district differences exist. Kongwa has the moderate planted area with improved seed in Dodoma region. The district also has the second smallest proportion of planted area with fertilisers (Farm yard manure, compost and inorganic fertiliser), however most of this is farm yard manure. Compared to other districts in the region, Kongwa district has the largest proportion of planted area applied with fungicide and herbicides and the second highest proportion of area applied with insecticide. It has the smallest area with irrigation compared to other districts with 24 ha only of irrigated land. The only source of water for irrigation available in the district is from rivers and bucket/watering is the only means of irrigation water application.

The percent of households storing crops in Kongwa district is the lowest in the region and the most common method of crop storage in the district is in sacks and/or open drums. The district has the second lowest percent of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Kongwa district has a moderate percent of households processing crops, however 86 percent of households process using neighbour's machines. The district has a relatively low percent of households selling processed crops mainly to neighbours. The district has the highest percent of households receiving credit in the region mainly from commercial banks. It is the only district receiving credit from commercial banks and saving and credit societies in Dodoma region.

A comparatively larger number of households receive extension services in Kongwa district and almost all of this is from the government. The quality of extension services was rated good by the majority of the households.

Tree farming is not important in Kongwa district (with 26,358 planted trees) and is mostly Senna with some Azadritacht. Kongwa district has the second highest proportion of erosion control and water harvesting structures in the region, however it has the highest proportion of vertiver grass, tree belts, dams and terraces.

The district has a moderate number of cattle in the region and compared to other districts it has the highest number of beef and dairy cattle. Although the district has second lowest number of goats in the region it has the second largest number of sheep. It has the largest number of pigs in the region and the second smallest number of chickens. Though small, the district has the third largest number of improved chickens mostly layers. It is the only district with turkeys and has a small number of ducks and donkeys. A number of households reported tsetse and tick problems in Kongwa district. The district has the highest proportion of household de-worming livestock. The use of draft animals in the district is moderate. There is no fish farming in the district.

It is amongst the districts with the best access to secondary schools, all weather roads, hospitals, health clinics, primary markets and tarmac roads compared to other districts.

Kongwa district has the smallest percent of households with no toilet facilities and it has the highest percent of households owning radios, landline phones, mobile phones, irons, wheelbarrows, bicycles and vehicles. It has the highest proportion of households using solar and hurricane lamps in the region. The most common source of energy for lighting is the wick lamp and large proportion of households (96%) use firewood for cooking. The district has a high percent of households with iron sheets (67%) and tiles (2%). The most common source of drinking water is from piped water. Kongwa had the least proportion of households having one meal per day and second largest proportion of households having three meals per day. The district has the lowest percent of households that did not eat meat during the week prior to enumeration, however it has the third highest percent of those who did not eat fish. It has the highest percent of households that never experience food shortage problems.

4.2.4 Dodoma Rural

Dodoma Rural district has the largest number of households in the region and it has the highest percents of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock production. Neither crop and livestock households nor pastoralists were found in the district.

The most important livelihood activity for smallholder households in Dodoma Rural district is Annual Crop Farming, followed by Off - farm Income, Tree/Forest resources, Livestock keeping/herding and remittances. The district has a high percent of households with no off-farm activities however it has the lowest percent of households with more than one member with off-farm income. Compared to other districts in the region, Dodoma Rural has the third largest percent of female headed households (23%) and it has the third largest average age of the household head. With an average household size of 4.2 members per household it is the lowest in the region. The literacy rate among smallholder households in Dodoma Rural is the lowest compared to other districts in the region and associated with this is the highest proportion of household members who have never attended school.

It has the second lowest utilized land area per household (2.1 ha) and largest total area planted with annual crops in the region. However, the district had the second smallest planted area per household in the wet season (0.66 ha) and largest area planted per household during dry season (2.9 ha).

The district is moderate important for maize production in the region with a planted area of 62,118 ha and the planted area per household is the second smallest in the region. Bulrush millet production is of most importance in the region with a planted area of 30,103 hectares and the district had the third largest planted area per bulrush millet growing household. The district has the largest area planted with sorghum and paddy in the region. Finger millet is also produced in a very small quantity. The district also has the second largest planted area of cassava (3,316 ha), however very little beans are produced. Oilseed crops are important in Dodoma Rural with the largest planted area of oilseeds in the region (28,042 ha), however the district had the third largest area panted with groundnuts in the region. Vegetable production is not important in the district, however tomatoes, onions and amaranths are produced in very small quantities.

Most land clearing is done by hand slashing and it has also the largest area of bush clearance in the region. Most land preparation is done by hand, however it has the third highest planted area cultivated by oxen. A small amount of land preparation is done by tractor.

The use of inputs in the region is very small, however district differences exist. Dodoma Rural has the highest proportion of planted area with improved seed in Dodoma region. The use of fertiliser is relatively high compared to other districts and is mostly farm yard manure and compost. It has a relatively small area planted with inorganic fertilisers. Compared to other districts in the region, Dodoma Rural district has the smallest percentage of the planted area in the district with fungicides application and the second smallest area of herbicide use. The district has the largest percent of area planted with insecticide use. It has the second smallest area with irrigation with a planted area of only 74 ha under irrigation. The only source of water for irrigation is from wells using hand buckets. Buckets/watering cans are the only means of irrigation water application in the district.

The proportion of households storing crops in Dodoma Rural district is the lowest in Dodoma region and the most common method of crop storage is in locally made traditional cribs. The district has a moderate proportion of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. Dodoma Rural has the lowest percent of households processing crops and is mostly done using neighbours machines. The district has a low percent of households selling processed crops mostly to secondary markets. There is little access to credit in the district of which all are from religious organizations/NGOs projects.

A comparatively high proportion of households receive extension services in Dodoma Rural and it is mostly from the government. The quality of extension services was rated between good and average by the majority of the households.

Tree farming is not important in Dodoma Rural with 102,885 trees dominated by Azadracht Spp and Senna Spp. The second highest proportion of erosion control and water harvesting structures is found in Dodoma Rural district and is mostly, gabions, terraces and erosion control bunds.

The district has the largest number of cattle in the region dominated by indigenous breed and very little dairy breeds. Goat and sheep populations are also the largest in the region. The district has a comparatively small number of pigs, but it has a comparatively moderate chicken population, dominated by indigenous breeds and very few layers and broilers. The district has the highest number of donkeys in the region. It has the second lowest proportion of households reporting Tsetse and tick problems in the region and it has the second highest proportion of households de-worming livestock compared to other districts. Draft animals use is relatively moderate and fish farming is not practiced in the district.

It is amongst the districts with good access to primary schools and feeder roads, however it has one of the worst access to all weather roads, hospitals and tertiary markets.

Dodoma Rural district has the highest proportion of households with no toilet facilities in Dodoma region. It has the lowest proportion of households with landline phones and irons. It has the smallest proportion of households using mains electricity, hurricane lamps, pressure lamps and candles; however it has the highest proportion of households using firewood for lighting. The most common source of energy for lighting is the wick lamp and almost all households use firewood for cooking. The district has the highest percent of households with grass and mud roofs with and 19 percent of households have iron sheet roofing. The most common sources of drinking water are from piped water and unprotected wells. It has the highest percent of households that did not eat meat and smallest percent of households that did not eat fish during the week prior to enumeration; however most households seldom had problems with food satisfaction.

4.2.5 Dodoma Urban

Dodoma Urban district has the smallest number of households as well as the smallest proportion of households involved in smallholder agriculture in the region. Most smallholders are involved in crop farming only, followed by crop and livestock production. It has neither livestock only households nor pastoralists.

The most important livelihood activity for smallholder households in Dodoma Urban district is off-farm income, followed by annual crop farming, tree/Forest Resources and livestock keeping/herding. However, the district has high proportion of households with no off-farm activities and a moderate percent of households with more than one member with off-farm income compared to other districts in the region, Dodoma Urban has the highest percent of female headed households (26%) in the region and it has the second lowest average age of the household head. With an average household size of 4.4 members per household it is the second smallest for the region. Dodoma Urban has the second highest literacy rate among smallholder households in and this is reflected by the relatively high level of those attending school in the region. The literacy rate for the heads of household is the lowest in the region.

It has the lowest utilized land area per household (1.6 ha) in the region. The total planted area is the smallest compared to other districts in the region, however it has also the smallest planted area per household (0.53 ha during wet season and 0.2 ha in the dry season).

The district has the smallest area planted with maize and smallest area planted per maize growing household in the region. The district has the second largest planted area of bulrush millet (22,634 ha) and lowest area planted with sorghum and paddy. Finger millet is produced in the district in small quantity. Cassava production is small accounting for only 8 percent of the cassava planted area in the region. The production of beans in Dodoma Urban is comparatively small (102 ha) and the area planted with cowpeas is moderate (885 ha). Other pulses produced in the district are of minor importance. Oilseed crops are not important in Dodoma Urban, and it has the second lowest area planted with groundnuts in the region. Simsim and sunflower are grown in small amounts. The district has the largest area planted with fruit and vegetables in the region which is dominated by tomatoes (732 ha) followed by amaranths. It has the largest area planted with tomatoes and amaranths in the region. Other vegetables are grown in small quantities.

Compared to other districts in the region, Dodoma Urban has low planted area with permanent crops which is dominated by mango (220 ha), guava (98 ha), grape (92 ha) and pawpaw (72 ha). Small quantities of banana, sugar cane, oranges and pigeon peas are also grown and other permanent crops are either not grown or are grown in very small quantities.

Most land clearing is done by hand slashing, however it has a high planted area with land cleared by burning. Most land preparation is done by hand, however it has a small planted area cultivated by oxen. A small amount of land preparation is also done by tractor.

The use of inputs in the region is very small, however district differences exist. Dodoma Urban has the largest proportion of its planted area with fertilisers (compost, Farm yard manure and inorganic manure), however most of this is compost). It has the smallest proportion of area planted with improved seeds. The district has a relatively moderate level of insecticide and herbicide use, however the use of fungicides was the second highest in the region. It has the second highest area of irrigation with 1,618 ha of irrigated land. The most common source of water for irrigation is from wells using hand buckets. Buckets/Watering cans are the most common means of irrigation water application and a very small amount of sprinkler and flood methods are used.

The proportion of households storing crops in the district is the second lowest in the region and the most common method of crop storage is in locally made traditional cribs and sacks/open drums. The district has the smallest proportion of households selling crops, however for those who did not sell, the main reason for not selling is insufficient production. The second lowest percent of households processing crops in Dodoma region is found in Dodoma Urban district and is mostly done on farm using neighbours machines. Virtually no processing is done on farm by machine. The district has a small percent of households selling processed crops mostly to neighbours and local markets/trade stores. There is little access to credit in the district and mostly it is from from religious organisations/NGO projects.

A comparatively high number of households receive extension services in Dodoma Urban district and a large percent of this is from the government. The quality of extension services was rated between Very good by the majority of the households.

Tree farming is relatively important in Dodoma Urban with 362,642 planted trees and is mostly Pinus spp with some Azadrachta spp, Syszygium Spp and Senna spp. The smallest proportion of erosion control and water harvesting structures is found in Dodoma Urban district and is mostly of terraces and erosion control bunds.

The district has the second lowest number of cattle in the region dominated by indigenous breeds with very few beef and dairy breeds. It has the lowest goat, sheep and chicken populations compared to other districts in the region, however it has the second largest layer population in the region. It has one of the smallest number of pigs in the region. A small numbers of ducks, donkeys and other livestock are also found in the district. There is a large proportion of households reporting tick related problems and the least proportion of households reporting tsetse related problems, however it has one of the smallest proportion of households de-worming livestock. The use of draft animals in the district is very small and no fish farming is practiced in the district.

It is amongst the districts with the best access to primary schools, all weather roads, secondary schools, hospitals, regional capital, tertiary markets and tarmac roads, however it has one of the worst accesses to the feeder roads and primary markets.

Dodoma Urban district has the third highest percent of households with no toilet facilities and it has no households owning mobile phones and vehicles. It has the highest proportion of households with access to mains electricity, biogas and candles. The most common source of energy for lighting is the wick lamp and most of the households use firewood for cooking. The district has a moderate percent of households with grass and mud roofs with 40 percent of households having iron sheet

roofing. The most common source of drinking water is from unprotected wells, followed by piped water. It has the highest percent of households having one meal per day compared to other districts and the second lowest percent with 3 meals per day. The district has one of the highest percent of households that did not eat meat during the week prior to enumeration; however it has the second lowest percent of households that did not eat fish during the respective period. The district has the largest percent of households that have food satisfaction problems in the region.

7.1 and 7.2c TOTAL ANNUAL CROP AND VEGETABLE PRODUCTION: Area planted (ha) and Quantity Harvested by Season and Crop for the 2002/03 agriculture year, Dodoma Region

*The total area planted include the sum of the planted area for both Wet and Dry Season and it is an overestimation of the actual area due to being produced on the same land during the two seasons. Previous surveys have used the Long/Wet Season to estimate physical land area under production to different crops

Definition and working page for page 1 eneral Definitions Small holder hh/small scale farm: Should have between 25sq metres and 20 Hectares under production, and/or between 1 and 50 head of Cattle, and/or between 5 and 100 head of Sheep/Goats/Pigs, and/or between 50 and 1000 chickens/turkeys/ducks/rabbits. Household: A group of people who occupy the whole or part of one or more housing units and makes joint provisions for food and/or other essentials for living. Household Head: A person who is acknowledged by all other members of the household either by virtue of his age or standing in the household as the head. He/she should be a permanent resident of the house and he/she is the main person responsible for making decissions. Agricultural Holding: This is an economic unit of agricultural production under single management. It consists of all livestock kept and all land used for agricultural production without regard to title. For the purpose of this survey, the agricultural holdings are restricted to those which meet one of the following conditions: - Having or operated at least 25 sq meter of arable land - Own or keep at least one head of cattle or five goats/sheep/pigs or fifty chicken/ducks/turkeys during the agricultural year 2002/03 (October 2002 to September 2003) . Question Specific Definitions: Procedures for Questions: Type of Agriculture Holdings Codes (Q2.1): - Crops only: A holding is referred to be a crops only holding if it has cultivated a piece of land equal or exceeding 25 sq Meter. This also applies to all households owning or have kept livestock whose number does not Q 2.1 Type of agriculture household/holding gualify such household to be an agricultural holding (No cattle, less than 5 goats/sheep/pigs, less than 50 chickens/turkeys/ducks/rabbits) Using the options under the question 1. classify the type of agriculture hh/holding - Livestock only: A holding is referred to be a Livestock only holding if it has exercised Livestock husbandry only during the agricultural year. The Note: If the hh had 1 acre of crops and raised 40 livestock can be herded in search for areas of pasture, but the core chickens during 2002/03 it is classified as 'Crops household unit always remains in the same place and the herder is rarely only' as the number of chickens do not qualify the away from this place for long periods at a time. hh as keeping livestock. - Livestock pastoralism: This refers to a household which practices livestock production as its major income generating activity and a means of subsistence, but moves from one place to another searching for water and pasture for the livestock. This movement usually involves long distances and in many cases the whole household unit moves with the livestock and they Q 2.2 Important hh livelihood activities have no permanent place of residence. /source of income For both livestock only and pastoralism , the number of livestock has to be at least 1 1. Read the list in column 1 to the respondent and head of cattle, 5 goats/sheep/pigs or 50 chickens/turkeys/ ducks/rabbits. This also ask him to rank them in order of importance during the applies to all households owning or have cultivated a piece of land less than 25 sq reference year. meter, which does not qualify such household be an agricultural holding. In column 2 Indicate the importance of each - Both crops and livestock: A holding is referred to be a both crops and activity by placing '1' against the most important, '2' livestock if it has cultivated a piece of land equal or exceeding 25 sq meter against the second most important, etc until you reach and if such households is owning or have kept livestock whose number '7' the least important activity/source of income. qualify such household be an agricultural holding. Note: You must attempt to fill in all boxes. Most Important livelihood activities/source of income (Q 2.2): households will carry out these activities to a greater or lesser degree. You will normally have to - Crop farming: This refers to a household where crop production is its probe to get remittances. major means of subsistence and income generation. If the hh did not undertake an activity during the - Livestock farming/herding/pastoralism: This refers to a household where 2002/2003 agriculture year then mark the livestock farming/herding is its major means of subsistence & income appropriate box in column 2 with an 'X'. generation. For each activity/source of income assign a - Off Farm Income This refers to cash generated from activities other than percentage. The enumerator should assist the from the households holding. This can be from permanent employment (eg respondent in assigning the percentage based on the government/other), temporary employment/labouring and includes cash information provided by the farmer. generated from working on other farmers farms. After completing column 3 make sure the -Remittances: Assistance from family members who are not currently part of percentages add up to 100. the household, or from a relative or family friend. This assistance is usually in the form of cash but it can also be in-kind (eg food, clothes, building material, Note: It is not essential to be 100% accurate. This farm tools, etc). The money is a gift and is not paid back. question is just to give the relative importance of the different items in general terms -Fishing/hunting and gathering The use of non farmed resources for food eg fishing, hunting wildlife and gathering mushrooms, berries, wild honey roots from uncultivated land.

Definition and working page for page 2

Question Specific Definitions: Relation to head (Col 2):

- Household Head: A person who is acknowledged by all other members of the household either by virtue of their age or standing as the household head.

Read and Write (Col 7):

- Any other language: Must be a written language.

For someone who can read and write in Swahili and any other language apart from English, the correct code is 1. For one who can read and write in English and any other language apart from Swahili the correct code is 2. Code 4 should only be used for another language but not English or Swahili

Education Level Reached (Col 9):

Indicate the highest level only. For those still attending school fill in the last year reached before the survey period. For example if a hh member is currently in standard 7 this year his highest grade reached is standard 6

Main Activity (Col 11):

- Crop farming: The persons main activity is crop production. This can be annual crops, vegetables, permanent crops or tree farming.

- Livestock farming/herding: The persons main activity is livestock farming/herding. The livestock can be herded in search for areas of pasture, but the core household unit always remains in the same place and the herder is rarely away from this place for long periods at a time. This category also includes fish farming but not fishing.

- Livestock pastoralism: The persons main activity is in moving livestock from one place to another searching for water and pasture for the livestock. This movement usually involves long distances and in many cases the whole household unit moves with the livestock and they may have no permanent place of residence.

-Paid employment - In full time employment earning a cash income

- Government/Parastatal In full time employment for a government
- Ministry, Department or Board that is controlled by the Government - Private/NGO/Mission/etc - employed by Non public/government
- organisation

-Self employee - works for own business for cash income

- With employees Works for own business for cash and employs other workers
- Without employees Works for own business for cash but does not employ other workers

- Not working but available to work - No productive activity but would like to have one.

- Not working & nor available for work - No productive activity and does not want to have one.

- Unable to work too old, too young, retired, disabled, etc

Off-farm Income (Col 12) - Income made from activities NOT on the HH's farming activities. This can be any off farm income generation activity and includes working for cash on other peoples farms.

Indicate whether each member was involved in an off farm income generating activity during 2002/03

Overview to section 3.0

Section 3.0 - Preliminary note

1. Make sure that you define the hh properly to ensure that all the members of the hh are included. Make sure you stress that the hh is not just the hh heads direct family and that it includes other people living and eating together with the family.

2. If you notice that his house is large or you see many people around his house and he has only given you small number of hh members enquire further until you are sure that you have captured all the hh members.

Procedures for questions

Section 3.0 - Household Information

- 1. For each household member complete columns 1, 2 & 3.
- After completing columns 1, 2 & 3 for each household member go back to the first household member and complete the remaining columns for that member.
- 3. Repeat step 2 for the rest of the household members

IMPORTANT NOTE:

Cross check responses in columns 11 and 12 with section 2 especially in relation to:

off-farm income - if a hh member was involved in off farm income then there should be a response in question 2.2.4 and vice versa.

Definition and working page for page 3 Question Specific Definitions	Distance to fields (Q6.1):
Section 4.1 - Land Access/Ownership Lease/Certificate of Ownership Area under lease/certificate of ownership refers to the area for which the household possesses a government issued leasehold title or certificate of ownership. The land will normally be officially surveyed and boundaries marked. This includes leased land bought from	-fields A field is a contiguous piece of land holding which the farmer considers as a single entity. The field may be divided into plots for growing different crops. A holding may consist of one or more fields in different localities.
 others where the lease/certificate of ownership has been transferred. Customary Law: This refers to the land which the hh does not have an official government title to but its right of use is granted by the traditional leaders. This user-right agreement does not have to be granted directly by the village leaders as right of access may be passed on through heredity. Bought: This refers to the area of customary land that has been bought from others. This land does not have an official title and therefore is not leasehold. Rented from others: Land rented from others for Cash or for a fixed amount in crop produce (eg fixed number of bags at harvest). Borrowed: Use granted by land owner free of charge. Land owner can either be a lease holder or has right of access through customary law. Share Cropping: where the hh is permitted to use land which is then paid for from a percentage of the harvested crop. 	Use of Communal Resources (Q6.2): -Communal resources - refers to the place on which all individual households can have access to. It is not individually owned or controlled by one hh. NOTE: The listed resources refers to communal resources and not those individually owned or part shared. The resource has to be freely accessible to the whole village Overview to section 4 Section 4.0 - Preliminary note Land Access/Ownership Access/Ownership refers to the area utilized by the members of the household. This does not include communal land where the resources are shared
Section 5.0 Land Use - Temporary crops: are sown and harvested during the same agricultural year	between households. It does include official communa land that the hh has sole access to eg a plot for crop farming in the communal area.
 Permanent crops: are sown or planted once and then , they occupy the land for some years and need not to be replanted after each annual harvest. Permanent crops are mainly trees (e.g., apples) but also bushes and shrubs (e.g., berries), palms (e.g., dates), vines (e.g., grapes), herbaceous stems (e.g., bananas) and stemless plants (e.g., pineapples). Mixed Crops: This is a mixture of two or more crops planted together 	 Procedures for Questions Section 4.0 - Land Ownership 1. Ask the respondent if he knows the total area of land the household has sole access to. If he knows make a note in the calculation space 2. Ask the respondent the area of the different land
and mixed in the same plot/field. The two crops can either be randomly planted together or they can be planted in a particular patterm eg intercropping (1 row of maize and 1 row of beans). A field that has been divided into plots for different crops is not mixed. This is further subdivided into: Permanent Mixed -two or more permanent crops grown together, Permanent/Temporary Mix - permanent crop and annual crop together,	 ownership categories the household has sole access to (Q4.1.1 to 4.1.7) and record in the appropriate spaces. 3. Add up the area of the different categories of land and compare it with the total area obtained in step 1 (if the respondent provided the information).
 Temporary Mixed - two or more temporary, annual crops grown together. Pasture Land: This is an area of owned/allocated land which is set aside for livestock grazing. It can be improved pasture where the farmer has planted grass, applied fertilized or applied other production increasing technologies to 	4. If the total area is different find out which one is correct and make amendments where appropriate.
 Fallow: This is the area of land that is normally used for crop production, but is not used for crop production during a year or a number of years. This is normally to allow for self generation of fertility/soil structure and is often an integral part of the crop rotation system. 	 Section 5.0 - Land Use Ask the respondent the area of the different landuse categories the household has sole access to (Q5.1.1 to 5.1.12) and record in the appropriate spaces. Add up the area of the different categories of land
 Natural Bush: Land which is considered productive but is not under cultivation or used extensively for livestock production and has naturally growing shrubs and trees. -Planted trees: Land which is used for planting trees for poles or timber 	and compare it with the total area obtained in section 4.0. The total area should be the same.3. If the total area is different find out which one is correct and make amendments where appropriate.
- Unusable: Land that is known to be non-productive for agriculture purposes Uncultivated Usable: This is land that was not used for reasons other than fallow. The reasons could be lack of inputs/money/rainfall/etc	Section 6.2 Communal resources Note: the code "Not available" means that th resource does not exist. The code "Not Used means that the resource does exist but is not use by the hh.

Definitions and working page for page 6

Pern not t also	nanent Crop: nanent crops: are sown or planted once and then , they occupy the land for some years and neec o be replanted after each annual harvest. Permanent crops are mainly trees (e.g., apples) but bushes and shrubs (e.g., berries), palms (e.g., dates), vines (e.g., grapes), herbaceous stems , bananas) and stemless plants (e.g., pineapples).	Perma Code 44 45 46
	I number of plants: includes both mature harvestable plants and immature non harvestable plants.	Perma
	nber of mature plants: This is the number of plants which bared harvest.	Code 53 54 55
А. В.	For fields that are monocrop permanent , ONLY enter the area of plants in column 3 . For fields that are mixed permanent calculate the area of each crop based on the % occupied by each crop method (NOT using the number of trees method) and ONLY enter the area in column 4	56 57 58 59 60 61 63
C.	 For fields that are mixed permanent/annual either: ONLY enter the area in column 4 if the area of the permanent crop was based on the % occupied by each crop method OR ONLY enter the number of trees in column 5 if the number of permanent crop plants was provided 	64 65 66 18 34 21 75

Temp	orary/annual cr	op codes for se				General Definition for Section 7.4
		Secondary	Agroprocess			Secondary Products: Second most
Crop	Crop	Product	Main Products	Bi-produc	t (Sect 8.0)	important product from a crop. Eg a
Code	Name	Question 7.4	(Section 8.0)	1	2	household may consider the grain from
11	Maize	Stems/straw	Flour	Bran		maize as the primary product and the
12	Paddy	Stems/straw	polished rice grain	husk		stems/straw as the secondary product.
	Sorghum	Stems/straw	flour			sterns/straw as the secondary product.
14	Bulrush Millet	Stems/straw	flour			
15	Finger Millet	Stems/straw	flour			Note: Secondary products are NOT the
	Wheat	Stems/straw	flour	Bran		same as bi-products. By-products are
	Barley	Stems/straw	flour	Bran		the result of a processing activity and
	Cassava	Leaves/stems	flour			are dealt with in section 8.0.
	Sweet Potatoes	Leaves				
	Irish potatoes					Procedures for Questions
	Yams					Q 7.6 Details of Secondary Products:
	Cocoyams					-
	Onions					1. From the list of crops in Q 7.1.2,
	Ginger					7.2.2 & 7.3.2, ask the respondent if the hh
	Beans	straw/stems				used any secondary products. List the
32	Cowpeas	straw				
	Green gram	straw				crop names and codes in column 1 and 2
	Pigeon peas	stems				for those crops that the hh used
	Chick peas Bambara nuts	straw straw/stems	oil	oako		secondary products.
	Sunflower		oil	cake		2. For the listed crops give details of
	Simsim	Stems straw	oil oil	Cake Cake		the secondary products used.
	Groundnut			Cake		3. If no units were sold, enter "0" in
	Soya beans	straw straw	oil oil	Cake		columns 8 & 9.
	Caster seed	straw	oil	Cake		
	Pineapple	Sudw	Juice	Care		
	Cotton	straw	fibre/seed	oil	cake	Q 8.0 Agroprocessing & bi-products:
	Tobacco	Suaw	IIDIE/SEEU	011	Care	1. From the list of crops in Q 7.1.2,
	Pyrethrum	straw	insecticide			7.2.2 & 7.3.2, ask the respondant if the hh
	Jute	50.400	fibre			processed any of these crops during the
	Cabbage		libic			2002/03 agriculture year. List the crop
	Tomatoes					names and codes in column 1 and 2 for
	Spinach					those crops that were processed by the
	Carrot					hh.
	Chillies		dried powder			
	Amaranths					
	Pumpkins	leaves				the secondary crops used.
	Cucumber					3. If no main product or bi-product was
	Egg Plant					sold enter "0" in columns 8 & 14.
	Water Mellon					If no bi-product was produced enter
96	Cauliflower					"0" in columns 10, 11, 12, 13 &14.
	Oil Palm	leaves	oil outer	oil inner	cake	
	Coconut	leaves/husk	milk			
	Cashewnut	Fruit	fruit juice	shell liquid		Question Specific Definitions
	Sisal	stems	fibre	oil		Agroprocessing and bi-products (Q 8.2)
54	Coffee	stems	beans	husks		(Note: Agroprocessing refers to the
55	Теа	stems				
56	Сосоа	stems	сосоа	cocoa butter	-	processing of crops for hh utilisation
57	Rubber	stems				and for sale)
	Wattle	stems				
	Kapok	stems				Main Product (Col 5):
	Sugar Cane		sugar/juice	molasses	ethanol	Main Product after processing. Eg for
61	Cardamom					Paddy it may be the polished grain. For
	Banana	leaves/stems	juice			Maize it may be flour.
	Avocado	stems				Bi-Product code (Col 11): is the
	Mango	stems	Juice			
	Paw paw		Juice			secondary residue after processing, eg for
	Orange	stems	Juice			rice it may be the husk. for maize it may
	Grape fruit	stems	Juice			be the bran.
	Grapes	stems	Juice			
79	Mandarin	stems	Juice			Mainly used for (Col 5 & 11):
	Guava	stems				- Consumed by household can mean
	Plums	stems				
	Apples	stems				eaten or utilised in another way (eg by
	Pears	stems				animals) by the hh.
	Pitches	stems				
95	Lime/Lemon	stems	juice

Definition and working page for page 8 Question Specific definitions (Section 9.0)	Procedures for Questions
Crop Storage, Section 9	
 Method of Storage (column 4) - Locally made structure: The structures that have been inherited from their fore fathers - Improved locally made structure: Traditional structures that have been improved using modern technology. - Normal duration of storage: Often there are stored stocks from different seasons and different years. The normal duration refers to the number of months that the most of the crop is stored for. 	 Q 9.2 Details of Crop Storage: 1. For the crops listed indicate if the household stored any during 2002/03 in column 2. 2. Check that the crops correspond to the crop lists in Q 7.1.2, 7.2.2 & 7.3.2. If there is a difference inquire on the reason why. It is possible that a crop was missed during the enumeration of these questions and if so make necessary amendments 3. For the listed crops give details of storage.
 Marketing problems Q 10.2 and 10.3 col 2: - Farmer Association: A village or community based group of farmers who have formed an organisation to purchase inputs/sell/store their products in order to achieve a better price for their products. - Cooperative Union: Large inter-village /community organisation set up on a district/regional or national basis for providing inputs, marketing and storing farmers products. - Government Regulatory board: Government control body for setting prices and controlling quality of certain agriculture commodities. 	 Q 10.2 Details on Crop Marketing: 1. For each of the crops listed indicate the main problems in marketing during 2002/03 in column 2. 2. Check if the crops correspond to the crop lists list in Q 7.1.2, 7.2.2 & 7.3.2. If there is a difference inquire on the reason why. It is possible that a crop was missed during the enumeration of these questions and if so make necessary amendments Q 10.3 Ranking of market problems: Rank in order of importance the 5 most important marketing problems from the codes in the Market Problems code box.

verview of Investment activities (Section 11.0) Investment activities: Investment activities refer to medium to long term farm development structures and pr and water harvesting structures or other permanent or semi-permanent investment me	
uestion Specific Definitions (Q 11.1)	
Source of irrigation Water (Col 1): The main source of water from which water is	
obtained for irrigation.	Q 11.1 Irrigation
Method of obtaining water (Col 2): The mechanism by which the water is extracted from the source,	1. If the hh practices irrigation give details on the main source, main method
 Application Method (Col 3): How the water is applied on the field. Flood - is the application of water down the slope of the land by means of gravity 	of obtaining and applying water. 2. Cross check column 8, Q 7.1.2,
- Sprinkler - is the application of pressurised water through pipes. The water passes through a device which sprays the water onto the crop from above.	7.2.2 & 7.3.2 to check if irrigation was used on any crops.
Irrigatable Area (Col 4): The area the irrigation system is designed to cover in acres.	
Area of irrigated land this year (Col 5): Area of land under irrigation during the 2002/03 agric year. This is the physical area and NOT the cumulative area of 2 or more croppings.	
uestion Specific Definitions (Q 11.3)	
Erosion control/water harvesting structure (Col 1)	Q 11.3 erosion control/water
Terraces: Are structures constructed on the side of a hill to provide a level ground to plant crops. They are often used to trap water for paddy/lowland rice production.	harvesting 1. Number of structures refers to the
Erosion Control Bunds: These are banks of earth/stones built perpendicular to the slope to slow down water and prevent erosion. They are different to Terraces in that the soil behind the banks are not level.	number of working/maintained structures and does not include derelict or irreparable structures.
Gabions: A gabion is a wire mesh box filled with rocks/stones and used to control or prevent gully erosion	2. Year of construction refers to the year that the structures were first
Sandbags Used to prevent or control gully erosion	constructed. It is not the year that the structures were last maintained.
Tree belts/Wind breaks: A band of trees planted perpendicular to the prevailing wind whose main purpose is to slow down wind speed	
Water Harvesting bunds: A bank of earth constructed horizontal to the slope of the land to trap water. They are usually banana shaped.	
Dam: A bank of earth/material which traps river water to form a catchment of water behind it.	Q 12.0 Farm Inputs
	 Indicate in column 1 whether each of the inputs are used or not.
Farm Inputs (Q 12.1.1 to 12.1.7)	
Farm yard Manure: An organic fertiliser made on farm composed of animal dung. Compost: An organic fertiliser made on farm from decomposed plant material	2. Complete cols 3, 4, 6, and 7 for inputs that are used and place '9' in column 5 (for not applicable).
Pesticide: Chemical used to either protect the plant from or kill insects, birds, nolluscs, mites, etc attacking the plant	 Complete cols 5 & 7 for inputs no used.
Fungicide: is a chemical that s used to protect the plant from or control a fungal disease.	NOTE: Cross check column 6, 7, 8 8
	9 , Q 7.1.2, 7.2.2 & 7.3.2 to check what inputs were used.

eneral Definitions for section 14.0	Section 14.2 Details of planted trees
 Tree Farming/Agroforestry This section refers to trees planted for wood (firewood, poles, planks, carving, charcoal, medicinal, etc, but NOT fruit trees). It does not include naturally growing trees on the farm (unless special care has been given to promote their establishment) or trees growing naturally on the communal areas. Tree farming is the planting of trees on an area of land for which the main purpose is the production and regeneration of trees for wood on that land. Agroforestry: is the planting of trees on land for the purpose of complementing other farming activities like crop and animal production. For the purpose of this questionnaire Agroforestry trees are trees planted on boundaries and scattered throughout fields. The main productive unit in this case is Crops and Livestock. 	 Enter the tree codes of the main species grown by the hh If no planks or poles are sold enter a "0" in columns 8, & 9. Total value includes both value of hh utilised trees and sold trees. If no trees were utilised by the hh or sold enter "0" in column 10
Puestion Specific Definitions Tree farming (Section 14.0) Pole trees (Col 6): These are young trees which have a maximum diameter of 6 inches at the bottom and are often used for house construction. They are often the thinning harvest after 3 - 5 years. Plank trees (Col 7): Trees for sawing into timber planks. Animal shade: Trees grown for the purpose of providing shade to animals.	 Section 15.1 Crop Extension Services 1. For each of the extension providers ask if the hh received extension during 2002/2003 agriculture year and indicate in column 2. 2. For each of the providers complete the rest of the columns
Community tree planting scheme (Section 14.3) Community Forest: A forest planted on the communal land which is planted, replanted or spot planted by the members of the village.	
 Crop Extension Services (Section 15.1) Contact Farmer: A farmer who is used by the extension agent as a focal point to demonstrate new interventions. The contact farmer then passes on the message to other farmers Group member: Member of a group under which the contact farmer leads Adoption: This is the uptake of an intervention for 2 or more years

Crop Extension Advice (Section 15.2)

Mechanisation/LST: LST means Labour Saving Technology

Section 16.0 Livelihood constraints

16.1 List the five most important problems in order of most importance:

1. Read out the list of constraints to the respondent and ask him to select the ones that are a problem. Place a \checkmark against the constraints that are a problem.

2. Read the selected constraints and ask the farmer to select 5 which create the largest problems

3. Ask the farmer to list these in order of importance and enter in column 2

16.2 List the five least important problems in order of least importance:

1. Read out the list of constraints to the respondent and ask him to select the ones that are **NOT** a problem. Place an × against the constraints that are **NOT** a problem.

2. Read the selected constraints and ask the farmer to select 5 which create the least problems

3. Ask the farmer to list these in order of least importance and enter in column 2

Definitions and working page for page 14	
Goat definitions for page 14	Section 19.0 Goat Population, Intake & Offtake.
Goat Intake during 2002/03: Goat purchased, given or born which increases the number of goats in the herd. Goat Offtake during 2002/03: Goat removed from the herd, either by selling, hh consumption, given away or stolen.	NOTE: Section 19.1 is for the current population (as of 1st October 2003); Section 19.2 and 18.3 is for movement in and out of the herd during the 2002/03 agriculture year. Section 19.4 is for diseases encountered during the agriculture year.
Question Specific Definitions (Section 19.0)	1. If the household has she goats, you would normally expect them to have kids in column 8
Goat type (Q 19.2 & 19.4, Col 1)	2. If kids are reported in column 2, 3, or 4 (19.2.6, 19.2.5) then there must be at least that number repeated in column 8
Billy Goat (he-goat): Mature Uncastrated male goat used for breeding Castrated goat: Male goat that has been castrated.	Note: If the farmer reports sales of goats the importance of this must be reflected in Q 2.2.3
She Goat: Mature female goat over 9 months of age	Section 19.5 If goats are reported to have died in Column 5 then at least that number should be reported in 19.4 col 4
Kid: Young goat under 9 months of age.	
	Working area for page 14
Average Value per Head (Q 19.3, (Col 7 & 9) & 19.4 (Col 3, 5 & 7))	
In these columns give the average value per head during 2002/03. For given, traded, consumed by the hh & given away/stolen estimate the value.

Definitions and working page for page 15 Sheep definitions for page 15	Section 20.0 Sheep Population, Intake & Offtake.
 Sheep Intake during 2002/03: Sheep purchased, given or born which increases the number of Sheep in the herd. Sheep Offtake during 2002/03: Sheep removed from the herd, either by selling, hh consumption, given away or stolen. 	NOTE: Section 20.1 is for the current population (as of 1st October 2003); Section 20.2 and 20.3 is for movement in and out of the herd during the 2002/03 agriculture year. Section 20.4 is for diseases encountered during the agriculture year.
Question Specific Definitions (Section 20.0)	1. If the household has ewes, you would normally expect them to have kids in column 8
Sheep type (Q 20.2 & 20.4, Col 1)	2. If lambs are reported in column 2, 3, or 4 (20.2.6, 20.2.5) then there must be at least that number repeated in column 8
Ram: Mature Uncastrated male goat used for breeding	Note: If the farmer reports sales of Sheep the importance of this must be
Castrated sheep: Male sheep that has been castrated.	reflected in Q 2.2.3
Ewe: Mature female sheep over 9 months of age	Section 20.5 If Sheep are reported to have died in Column 5 then at least that number should be reported in 20.4 col 4
Lamb: Young sheep under 9 months of age.	
	Working area for page 15
Average Value per Head (Q 20.3, (Col 7 & 9) & 20.4 (Col 3, 5 & 7))	
In these columns give the average value per head during 2002/03. For given, traded, consumed by the hh & given away/stolen estimate the value.

Definition and working page for page 17	
Question Specific Definitions Section 26.0)	Procedures for questions
	 Section 23.0 - Other Livestock: 1. The current number includes both adult and young animals. For example The number of chickens in col 1 would include adults and chicks.
Question Specific Definitions Section 27.0)	
Access to functional Livestock Structures/accessories (Section 27.0):	Section 26.0 - Outlets for livestock:
NOTE: The structures must be functional. If they are not working/derelict then they should not be included. The distance to the next nearest functional structure should be taken.	Using the codes enter the outlets for the sale of different livestock in order of importance. If there are, for example, only 2 outlets mark the rest with
Spray Race: A fixed spray structure on an animal race for spraying acaricide	a "X".
Cattle crush: Corridor structure for restraining cattle. Abattoir: Large building designed for slaughtering a large amount of	
animals. It normally has complex structures to assist in the slaughter and storage and a high level of hygiene is maintained.	
Slaughter Slab: Concrete slab designed fos slaughtering a small amount of animals	
Hides: obtained from Cattle	
Skins: Obtained from sheep and goats Hide/Skin Shed: Shed for curing/tanning animal skins and hides	
Village holding Pen: Enclosure for containing large amount of livestock which is owned communally.	
Drencher: Device for orally administering medicine to livestock. If no product was sold in 2002 enter "0" in columns 6, 7& 9.

efinitions and working page for page 18 eneral definitions for Section 28.0	Working area for page 18
ish farming: Refers to the rearing/production of fish. It is different to fishing in that the fish have be reared and fed in fish farming. Fishing traps or captures naturally occurring fish in rivers, lakes nd the sea and should not be included in this section.	
uestion Specific Definitions (Section 28.2)	
 Production unit number (Col 1): A production unit is a pond river/lake which is treated as a separate entity for the production of fish eg it may be by virtue of manageable size, maturity of fish, type of fish etc. Eg a farmer may have 3 fish ponds. (each one is a separate production unit). Frequency of stocking (Col 5): What is the number of times the farmer puts new fingerlings into the pond each year. Fingerlings: These are young immature fish used for stocking ponds. 	
Sold: (Col 10 & 11) If no fish were sold enter "0" in column 10 and 11)	
Livestock Extension Services (Section 29.1)	
Adopted (Col 3): This is the uptake of an intervention for 2 or more years	
Livestock Extension Service providers (Section 29.2)

Definition and working page for page 19 Question specific definitions (Section 31.1)

Activity (Col 1):

Land Clearing: Refers to removing trees/bush/grass prior to ploughing

Soil Preparation: Refers to the seedbed preparation (ploughing, harrowing, etc).

Cattle Rearing: Tending to cattle at home, eg assisting with births, castration,etc. Different livestock keeping activity to herding.

Cattle Herding: Moving livestock from place to place for grazing and water. If herding is carried out the respondent must also give a response to rearing/husbandry

Question Specific Definitions (Section 32.0.0) Activity (Col 1):

Subsistence: For the family's survival, rather than for the generation of cash. This includes feeding the hh, provision of water and fuel for cooking. The source of these products are usually from the land resources available to the family. Remember that not all cash earnings are for non subsistence purposes/activities as cash can be used to purchase subsistence items eg food.

Non -subsistence: Cash used for items and activities which are not crucial for the survival of the family. This includes modern medication, non working clothes, refined beer, school fees, etc.

Procedures for (Section 31.1)

Section 31.1 ((Labour use)

1. For each listed activity in column 1, place a tick in column 2 if any member of the household was involved in that activity during the 2002/03 agriculture year.

2. After completing column 2 return to the first activity in row 27.1.1 and complete column 3.

3. Make sure you stress MAINLY responsible.

NOTE: If an activity has been mentioned previously in the questionnaire eg that the hh keeps chickens, make sure a response is obtained in the appropriate place ie poultry keeping.

If off-farm income generation is mentioned, check for responses to off farm income in other parts of the questionnaire

Section 32.0 - Subsistence vs Nonsubsistence

1. For each listed activity in column 1, place a tick in column 2 if any member of the household was involved in that activity during the 2002/03 agriculture year.

2. After completing column 2 return to the first activity in row 32.1.1 and complete column 3 & 4. For each activity make an assessment of the percentage used for subsistence survival and the percent converted to cash for non subsistence goods and items.

3. Make sure you stress MAINLY responsible.

NOTE: Cross check the responses with previous sections in the questionnaire. eg if a response is given to remittances check for an entry in question 2.2.5

Definition and working page for page 20

Household facilities (Section 34):

Number of rooms used for sleeping in the household (Q 34.1)

Include sitting room, dining room, kitchen, etc if used for sleeping. It also includes rooms outside the main dwelling

A room is defined as a space which is separate from the rest of the building by a permanent wall or division. A building/house that is not divided into rooms is considered to have one room.

Household assets (Q 34.2): these assets must be functioning. Do not include if broken.

Access to drinking water (Q 34.4): If there is more than one source, use the one, which the hh uses most frequently.

Main source of hh cash income:

Activity that provides the hh with the most cash during 2002/03 agriculture year.
