PRESS RELEASE

Date: 24th April, 2017

PRODUCER PRICE INDICES FOR March, 2017

Introduction

The National Bureau of Statistics hereby releases the Producer Price Index (PPI) for the January-March quarter of 2017. Producer Price Index measures the average change over time in the prices received by selected domestic producers for the production of their goods. A basket includes a list of selected commodities of goods that are being priced on quarterly basis. The producer prices are collected as at 15th of the mid-month of every quarter that is February, May, August and November for Quarters (January-March), (April-June), (July-September) and (October-December) respectively.

Weights and a Reference Period

The index weights are based on gross output derived from the 2008 Annual Survey of Industrial Production. The PPI on this release reports the price indices with reference to March 2013, as the base period. It shows the producer price changes since March 2013 on three major sub-sectors of industry (Mining, Manufacturing, and Utilities).

Classification

As shown on the Table 1, Commodities Classification follows the International Standard Industrial Classification of All Economic Activities (ISIC) Rev.4.

Methodology

In the process of deriving the structure and weights, a top-down approach was adopted, the basket was selected and 2008-based weights calculated. A top-down approach was adopted for the calculation of the weights in order to maximize the indirect representation of industries and items. A sample of establishments for inclusion in the price survey was then selected using cut-off sampling procedures.

The price relatives of the selected commodities on each four digit level of ISIC was computed. The first level of aggregation is the class 4-digit ISIC; these indices are the un-weighted Elementary Aggregate (EA) and are being compiled using the Jevons geometric mean aggregation formula which refers to Geometric Mean of the price relatives. The Elementary Aggregates indices are then being progressively combined to higher levels within the index structure (i.e. Group 3-digit, 2-digit division and 1-digit Section levels of the ISIC, and then the all groups level) using the standard base-weighted Laspeyres formula.

As shown above, all industry (overall index) recorded an increase from 115.1 for the fourth Quarter (October-December 2016) to 116.5 for the first Quarter (January-March 2017). The main industrial activities that lead to the increase in price for the first Quarter of year 2017 as shown in Table 2 were Manufacture of food products which recorded a increase of (15.0) percent and Manufacture of chemical and chemical products (4.4) percent.

On the other hand, Manufacture of tobacco products recorded the decrease of (-14.6) percent while Manufacture of other non-metallic mineral products decreases by (-12.7) percent.
