Foreword

The 2012 Population and Housing Census (PHC) for the United Republic of Tanzania was carried out on the 26th August, 2012. This was the fifth Census after the Union of Tanganyika and Zanzibar in 1964. Other Censuses were carried out in 1967, 1978, 1988 and 2002. The 2012 PHC, like previous others, will contribute to the improvement of quality of life of Tanzanians through the provision of current and reliable data for policy formulation, development planning and services delivery as well as for monitoring and evaluating national and international development frameworks.

The 2012 PHC was unique as the collected information will be used in monitoring and evaluating the Development Vision 2025 for Tanzania Mainland and Zanzibar Development Vision 2020, Five Year Development Plan 2011/12–2015/16, National Strategy for Growth and Reduction of Poverty (NSGRP) commonly known as MKUKUTA and Zanzibar Strategy for Growth and Reduction of Poverty (ZSGRP) commonly known as MKUZA. The census will also provide information for the evaluation of the Millennium Development Goals (MDGs) in 2015. The Poverty Monitoring Master Plan, which is the monitoring tool for NSGRP and ZSGRP, mapped out core indicators for poverty monitoring against the sequence of surveys, with the 2012 PHC being one of them. Several of these core indicators for poverty monitoring are measured directly from the 2012 PHC. The census provides a denominator for the determination of other indicators such as childhood mortality, rates of maternal mortality and others.

The success of the census depended upon the cooperation and contributions from the government, development partners, various institutions and the public at large. A special word of thanks should go to the government leaders at all levels, particularly the Minister for Finance; Minister of State, President's Office, Finance, Economy and Development Planning, Zanzibar; Members of Parliament; Members of House of Representatives; Councillors; Regional and District Census Committees chaired by Regional and District Commissioners; Field Assistants; Enumerators; Supervisors; local leaders and heads of households.

Our special gratitude should go to the following; DfID, Government of Japan, JICA, UNDP, UNFPA, UNICEF, USAID, World Bank and other development partners for providing assistance in terms of equipment, long and short term consultancies, training and funding. We would like to thank religious and political party leaders, as well as Non-Governmental

Organisations (NGOs), mass media and the general public for their contribution towards successful implementation of the census.

Last but not least, we would wish to acknowledge the vital contributions to the project by Hajjat Amina Mrisho Said, the 2012 Commissioner for Population and Housing Census and Mr. Mwalim Haji Ameir, the Census Commissar for Zanzibar. Special thanks should also go to the Management and staff of the National Bureau of Statistics and Office of Chief Government Statistician, Zanzibar. Their commitment and dedication made significant contributions to the overall efficiency of the census operations. We would also like to convey our appreciation to all other Government Officials who worked tirelessly to ensure successful implementation of the 2012 Population and Housing Census.

Second Vice President, Zanzibar

Executive Summary

This Disability Monograph provides in-depth analysis of the level, trend and pattern of disability in Tanzania. Specifically, it analyses and provides information on albinism and difficulties in the domains of seeing, hearing, walking, remembering, self-care and other difficulties using indicators based on data from the 2012 Population and Housing Census (PHC). Where data allows, comparisons are made with estimates from previous censuses, other sources as well as with other countries. The information is presented at national level then disaggregated by the area of Tanzania Mainland and Tanzania Zanzibar, rural and urban. It is also disaggregated by the 30 administrative regions in the country (25 in Tanzania Mainland and 5 in Tanzania Zanzibar). Important findings from the report are summarized below:

Chapter one describes the background, overview of census questions and changes since 2002, concepts and definitions and the quality of data.

Chapter two gives information on prevalence of persons with disability and marital status in Tanzania. At the national level 9.3 percent of the population aged 7 years and above had some form of activity limitation. Prevalence was higher on the Tanzania Mainland (9.3 percent) compared to Tanzania Zanzibar (7.3 percent) and was also higher in rural areas 9.9 percent than in urban areas 7.8 percent. It also appeared that the Prevalence across regions ranged from 4.3 percent in Manyara to 15 percent in Mara region. Also presents that more than fifty percent (56.3 percent) of persons with disability in Tanzania were married or living together, 29.1 percent had never been married and 10.3 percent were widowed. Majority (44.1 percent) of the older persons with disability (65 years or above) were married. This was followed by those widowed (39.1 percent) and the never married (6.9 percent).

Chapter three gives information on the education of person with disability. Out of 3,450,986 persons with disability aged 5 years and above, 2,228,280 (64.6 percent) were literate. The literacy rate of persons with disability in urban areas (81.3 percent) was higher compared with that of rural areas (58.7 percent). The literacy level among females without disability in Tanzania was higher (72.5 percent) compared with that of females with disability (60.9 percent). On the other hand literacy rate for males without disability was higher (83.2 percent) than that of males with disability (76.4 percent). There was a slight difference in literacy rate between Tanzania and Tanzania Mainland.

Results show that it was 51.5 percent of children with disability who were attending school compared with 52.7 percent of children without disability. Furthermore results indicate that children with disability who were attending school in Tanzania Mainland were 51.3 percent compared with 52.4 percent of children without disability. In Tanzania Zanzibar 60.0 percent of children with disability were attending school compared to 62.7 of children without disability.

Chapter four indicates that 70.2 percent of persons with disability in Tanzania were currently employed. The proportion of employed females (35.7 percent) was almost equal to that of males (34.5 percent). The situation was different in Tanzania Zanzibar where by only 49.9 percent of persons with disability were currently employed with 28.7 percent of males and 21.3 percent of females.

Results show that 67.1 percent of persons with disability in Tanzania were employed in the Agriculture, Commercial and Food Crops activities. Females (70.3 percent) were more involved in the above mentioned economic activity than males (63.8 percent).

Chapter five indicates that proportion of households headed by males with disability was 68.3 percent of all household headed by persons with disability. Females with disability headed the remaining 31.7 percent of the households. Also the proportion of household using electricity (Tanesco/Zeco) is lower among households headed by persons with disabilities than those headed by persons without disability (14.7 percent 20.1 presents respectively).

Summary of Key Indicators

Indicator	Number	Percentage
Prevalence Rate for Persons of Age 7 Years or Above		
Tanzania		
Both Sexes	3,157,516	9.3
Male	1,487,595	9.1
Female	1,669,921	9.4
Tanzania Mainland		
Both Sexes	3,084,091	9.3
Male	1,453,367	9.1
Female	1,630,724	9.5
Tanzania Zanzibar		
Both Sexes	73,425	7.3
Male	34,228	7.1
Female	39,197	7.4
Disability by Severity		
Some Difficulty	1,663,024	74.1
A lot of Difficulty	408,963	18.2
Unable	172,616	7.7
Marital Status (Person with Disability)		
Married	1,205,906	50.3
Never Married	697,102	29.1
Living Together	143,877	6.0
Separated	27,375	1.1
Divorced	75,294	3.1
Widowed	247,360	10.3
Current Economic Activity (Person with Disability)		
Employed	1,621,206	66.8
Unemployed	83,939	3.5
Inactive	720,048	29.7
Household Amenities(Main Source of Energy for Lighting)		
Kerosene	632,864	63.3
Electricity	163,478	16.4
Torch/Rechargeable Lamp	135,363	13.5
Others	67,340	6.7
Membership to Social Security Schemes (Person with Disability)		
National Health Insurance or Community Health (NHIF or CHF)	1,188,258	5.6
Public Service Pension Fund (PSPF)	360,403	1.6
Zanzibar Social Security Fund (ZSSF)	86,643	0.3
Parastatal Pensions Fund (PPF)	145,474	0.7
National Social Security Fund (NSSF)	398,181	1.8
Local Authorities Pension Fund (LAPF)	81,256	0.4

Chapter One

Introduction

1.1 Overview

This chapter describes the census background, disability questions used for 2002 and 2012 censuses, definitions of concepts, data quality and organization of monograph itself.

1.2 Census Background

Since early 1990 disability has been a subject in the international forums. In 1993 the United Nations (UN) adopted the Standard Rules on the Equalization of Opportunities for Persons with Disability and in 2006 UN adopted the Convention on the Rights of Persons with Disability.

The need for disability statistics is not a new phenomenon. Studies have been conducted worldwide and recommendations made for governments to design policies that address the needs of persons with disability.

The UN “Global Context of Disability by March 11, 2010”(UN, 2011) showed that, there were at least 650 million people with disability in the world of whom 400 million live in developing countries. The report further states that if all these people lived together they would make up the third largest country in the world, a country about equal in size of European Union. This country would be characterized by extreme poverty, illiteracy and unemployment to name but a few.

This observation is also echoed by the World Report on Disability (WHO, 2011) which reveals that more than 650 million people in the world in 2011 experienced disability. The report further proposed practical solutions to overcome barriers to health care, rehabilitation, education, employment and support services and create an enabling environment for persons with disabilities to prosper. This global perspective paints a general picture of the status of persons with disability and calls for national governments to respond to the needs and challenges faced by persons with disability. Tanzania has ratified the Standard Rules on the Equalization of Opportunities and the Convention on the Rights of Persons with Disabilities and its Optional Protocol and proceeded to put in place the National Disability Policy (2004) and the Persons with Disabilities Act (2010). Key recommendations of the policy include:

- Strengthen the existing basic health services,

- Develop a mechanism to ensure early intervention,
- Provide a conducive environment for the practice of inclusive education,
- Improve skills training and facilities for persons with disability,
- Provide work tools and seed money to enable persons with disability establish income generating projects,
- Take measures to ensure that public buildings and facilities are accessible,
- Provide institutional care to eligible persons with disability and create awareness for families to care for relatives with disability.

The 2012 Census is the second in the history of Tanzania to include questions on disability, the first was that of 2002.

1.3 Disability Questions for 2002 and 2012 Censuses

The 2002 Population and Housing Census disability questions were impairment based. The first of two questions asked whether a member of the household had any disability. If the answer was ‘‘yes’’ a second question asked the respondent to state the type of disability he or she had. The questions were general and disability cannot be fully captured through those two simple questions because there are many types of disabilities and each type of disability has degrees of severity. The 2002 questions lacked clarity and therefore may have resulted in missing out or excluding others.

The 2012 Population and Housing Census questions asked about albinism and difficulties in the domains of seeing, hearing, walking, remembering, self-care and other difficulties. Persons with disability were graded on a three point scales of severity: ‘‘some difficulty’’ ‘‘a lot of difficulty’’ and ‘‘cannot do at all’’. As can be noted the 2012 approach in questions was different from that of 2002 census. The new approach (derived from the work of Washington Group on Disability Statistics) reflects recent developments in the understanding and measurement of disability and is believed to provide internationally comparable data and a better description of disability in a population. Persons were more willing to report having a ‘‘difficulty’’ than having a ‘‘disability’’. This measure is more inclusive and measures the consequences of these difficulties on various aspects of person’s lives such as education, employment, household characteristics, access to services and social inclusion (NBS, 2008). It is important to note that albinism is recognized as a disability in Tanzania and is therefore included as such in this analysis.

1.4 Concepts and Definitions

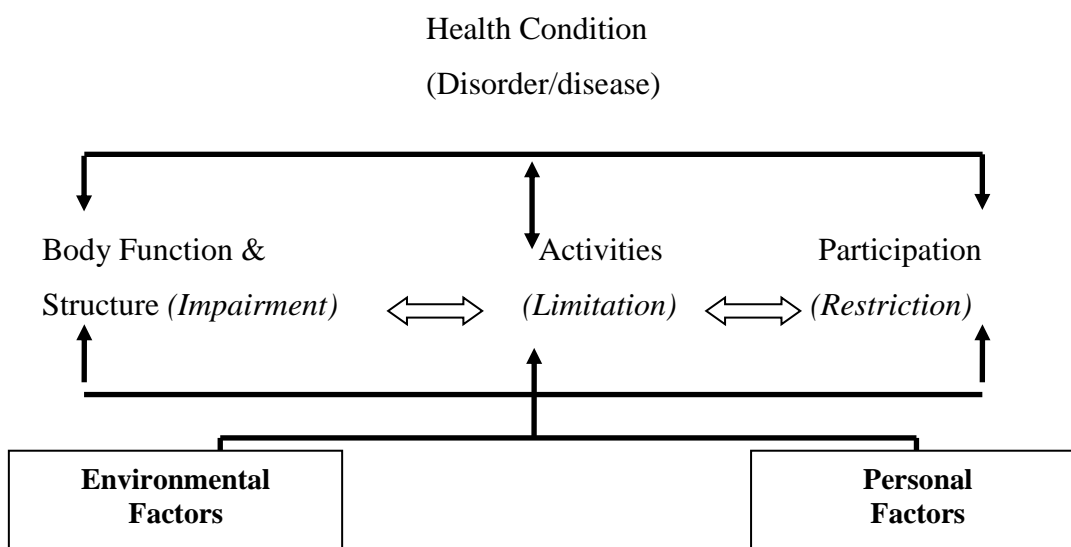

1.4.1 Concepts

Disability is conceptualized by two models, the medical and social models of disability (Barron and Amerena, 2006). The medical model of disability says that people are disabled by their impairment or differences. Under the medical model these impairments or differences should be fixed or changed by medical or other treatment even when the impairment or difference does not cause pain or illness. The medical model looks at what is considered wrong with a person not what a person needs. It creates low expectations and leads to people losing independence, choice and control in their own life.

People with disability developed the social model of disability (Shakespeare and Watson, 1997) because the medical model did not explain the personal experience of disability or help to develop more inclusive ways of living. The social model of disability says that disability is caused by the way the society is organized rather than a person's impairment or difference. It looks at ways of removing barriers that restrict life choices of people with disabilities. When the barriers are removed, people with disabilities can be independent and equal in the society with choice and control over their own lives.

The census methodology on capturing disability issues is based on the International Classification on Functioning, disability and healthy (ICF) issued by WHO in 2001.

Figure 1. 1: Interactions between the Parts of Components of ICF.

1.4.2 Definitions

According to ICF persons with disability are defined as those persons who are at a greater risk than the general population of experiencing limitations in performing specific tasks or participation in activities. Such persons may not experience limitations in specifically measured tasks, such as bathing or dressing or participation activities, such as working because the necessary adaptations have been made at the person or environmental levels. Yet these persons would still be considered to be at a greater risk of limitations in activities and or participation than the general population because of the presence of limitations in basic activity functioning.

The WHO (PAHO and WHO, 2006), defines disability as a generic term that includes impairments in body functions and structures, activity limitations and participation restrictions. It includes the negative aspects of the inter-action between an individual (with a health condition) and his context (environmental and personal factors).

According to the UN Convention on the Rights of Persons with Disabilities (2006) persons with disabilities include those who have long term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.

The National Policy on Disability (2004) defines a person with disability as an individual whose prospects of obtaining and retaining employment are greatly reduced due to known physical, mental or social factors. This analytical report adopts all the definitions.

1.5 Data Quality

According to the 2012 PHC Tanzania had 34,075,839 people of age 7 years and above in private household of whom, 3,157,516 were persons with disability (pwd) (9.3 percent). This prevalence is higher than that of 2008 disability survey which recorded a prevalence of 7.8 percent and yet higher than that of 2002 Census which was 2.0 percent. The significant changes in disability levels from 2002, 2008 and 2012 are likely not to have been caused by changes in the society but due to limitations which affect the quality of data collected. These limitations include differences in the definition of disability, different methods of data collection, poor infrastructure and attitudes of respondents and knowledge of enumerators. The 2002 PHC questions for example were impairment based while those of 2012 followed activity limitations and functioning approach. Due to differences in the understanding of

disability and attitudes of respondents some impairments and activity limitations may or may not constitute a problem worth recording. Poor infrastructure is yet another area that may affect data quality as some remote areas could not be reached. Training of enumerators is important to enable them perform their work effectively. However a few days training may not be enough for enumerators without previous experience in disability issues to acquire the required competence. It is important to note here that census questions did not ask about the causes of disability. Equally data for children with disabilities aged 0-7 years is not available because according to Washington Group on Disability Statistics of this age group cannot fully explain the difficulties in the substantive domains.

The UN Economic and Social Council Commission for Asia and Pacific (ESCAP, 2009) indicated that in many countries, disability data collection is at an early stage of development and that available data revealed that wide disparities exist in the region. In Africa South of Sahara, the prevalence of disability in selected countries shows the same disparity as indicated in chapter two.

The UN believes that the variance is due to differences in definitions of disability, methods of data collection as well as capacity of data collectors. There is no doubt that lack of reliable information impacts negatively on the planning for the provision of services to people with disabilities in the country as well as the creation of an enabling environment for the equalization of opportunities.

Despite the limitations mentioned above, the findings generally underscore the disadvantaged position persons with disabilities experience as far as access to basic services is concerned. It is important that planning at all levels should address the needs and challenges faced by people with disabilities.

1.6 Organization of the Monograph

This monograph consists of six chapters. Chapter one describes the background, overview of census questions and changes since 2002, concepts and definitions and data quality. Chapter two looks at disability prevalence by geography, types and severity. Chapter three examines the demographic characteristics of persons with disability in literacy and education. Chapter four describes the economic characteristics of persons with disability namely: usual economic activities, factors limiting the participation of persons with disability in economic activities, employment status, main economic activities and main occupation. Household

characteristics, household size, tenure, headship, assets and amenities are dealt with in chapter five while chapter six deals with summary, conclusion and recommendations.

1.7 Conclusion

The need for disability statistics cannot be overemphasized. The inclusion of pwds in all spheres of development requires the availability of correct information necessary for planning. For this reason the 2012 PHC disability questions were based on the work of the Washington Group on Disability Statistics which looks at difficulties (rather than impairments) people experienced in the domains of seeing, hearing, walking, remembering, self-care and other difficulties.

Both the medical and social model of disability have been examined. This monograph however adopts the ICF concept and definition of disability as encompassing impairments in body function and structures, activity limitation and participation restrictions and the negative aspects of the inter-action between an individual and his/her social environment. The 2012 PHC revealed that Tanzania has a population of 34,075,839 people aged 7 years and above of whom 3,157,516 were persons with disability representing 9.3 percent of the population aged 7 years or above. This prevalence is higher than that of 2008 TDHS which was 7.8 percent and yet higher than 2 percent of 2002 PHC. The changes in disability levels are attributable to limitations which affect data quality. These limitations include differences in the definition of disability, different methods of data collection, poor infrastructure and knowledge of enumerators.

Chapter Two

Prevalence and Distribution of Persons with Disability

2.1 Overview

This chapter provides a picture of prevalence of persons with disability in Tanzania, Tanzania Mainland, and Tanzania Zanzibar by rural and urban areas and sex. The chapter also presents distribution of persons with disability, marital status, estimates of disability by type and its severity.

2.2 Prevalence of Disability

Prevalence of disability is the number of persons born with disability or become disabled per 1,000 of the population in the country until a date of census or survey.

According to the 2012 Census 3,157,516 persons (9.3 percent) of the total population in private household in Tanzania aged 7 years or above had different types of disability. In other words, for every 1,000 persons in Tanzania in the year 2012, 93 persons had disability. The prevalence estimate of 9.3 percent was slightly lower than the global prevalence of 10.0 percent estimated by the United Nations. Table 2.1 indicates prevalence rates of disability for selected developed and developing countries.

Table 2.1: Prevalence Rates (%) of Disability for Selected Countries

Country	Year	Rates from Census Data	Country	Year	Rates from Surveys Data
Tanzania	2002	2.0	Tanzania	2008	7.8
Kenya	2007	4.6	Zambia	2006	13.1
Sudan	2008	4.8	Australia	2000	20.0
Ghana	2010	3.0	Ecuador	2005	12.1
Botswana	1991	2.2	Nicaragua	2003	10.3
USA	2000	19.4	New Zealand	1996	20.0
Canada	2001	18.5	Spain	1986	15.0
Brazil	2000	14.5	China	1987	5.0
Uganda	2001	3.5	Netherlands	1986	11.6
Mexico	2000	2.5	Egypt	1996	4.4
India	2001	2.1	Germany	1992	8.4

Sources: United Nations Statistics Divisions, IBGB (Brazil), INEC (Nicaragua), INEC (Ecuador), INEGI (Mexico), Statistics New Zealand, INE (Spain), Census of India 2001, SINTEF Health Research (Zambia) 2006

Generally developing countries tend to report lower percentages of persons with disability compared with developed countries. Some common factors leading to higher percentages of persons with disability in developed countries include a relatively high percentage of elderly people and survival rates compared to developing countries.

2.3 Distribution of Persons with Disability by Geographical Area

Figure 2.1 presents prevalence rates of disability for Tanzania, Tanzania Mainland and Tanzania Zanzibar by sex. At the national level 9.3 percent of the population aged 7 years and above from private household had some form of activity limitation. The prevalence was higher in Tanzania Mainland (9.3 percent) compared to Tanzania Zanzibar (7.3 percent), and it was also higher in rural areas (9.9 percent) than in urban areas (7.8 percent). Results further show that the proportion of persons with disability was relatively higher among females (9.4 percent) compared with males (9.1 percent).

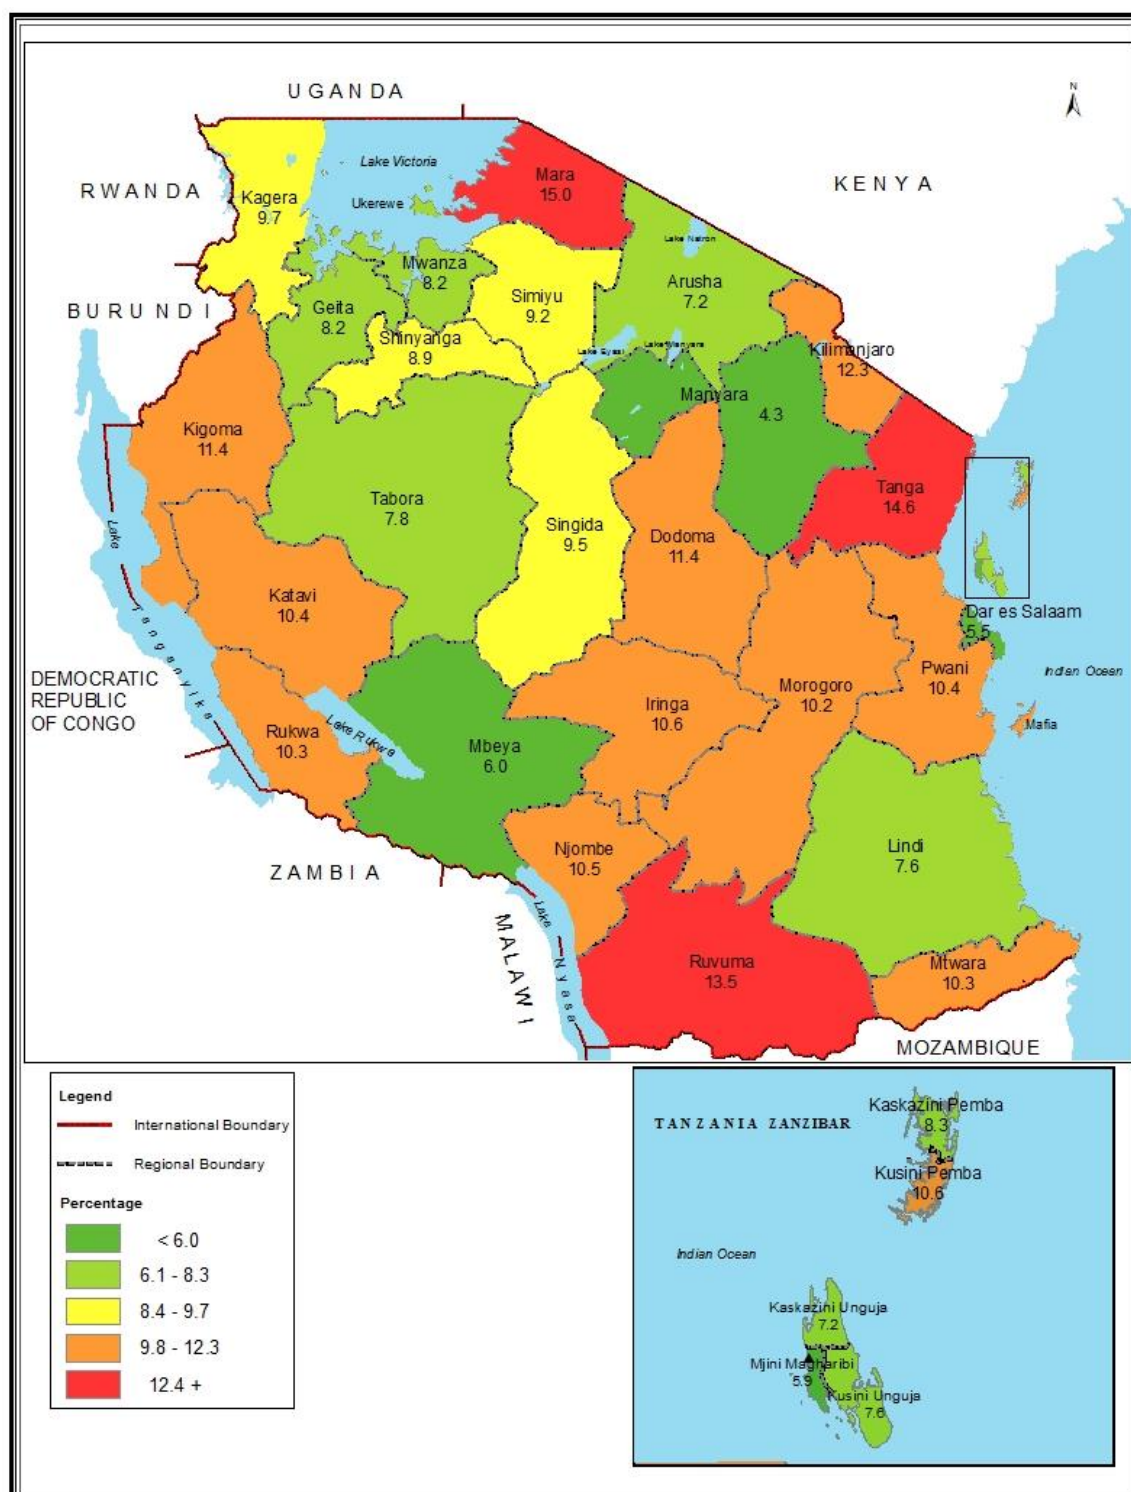

Figure 2. 1: Disability Prevalence Rate for Persons of Age 7 Years or Above by Residence, Rural and Urban Areas and Sex; Tanzania, 2012 Census

Prevalence of disability varies by regions. The highest disability prevalence rate was recorded in Mara (15.0 percent) followed by Tanga (14.6 percent) and Ruvuma (13.5 percent). On the

other hand, lowest disability prevalence rate was recorded in Manyara (4.3 percent) followed by Dar-es Salaam (5.5 percent) and Mjini Magharibi (5.9 percent).

Map 2. 1: Disability Prevalence Rate (%) for Persons of Age 7 Years or Above with Disability by Region; Tanzania, 2012 Census

2.4 Prevalence Rate of Persons with Disability by Age and Sex

Tables 2.2 to 2.4 present the prevalence rate of persons with disability by age groups and sex in Tanzania, Tanzania Mainland and Tanzania Zanzibar for the population aged 7 years and above. Table 2.2 indicates that, in general, disability prevalence rate was higher among older people as compared to young one, varying from 33 percent for persons aged 80 years and above to only 8.3 percent for those aged 7 to 11 years.

Table 2. 2: Prevalence Rate (%) of Persons of Age 7 Years or Above with Disability by Age and Sex; Tanzania; 2012 Census

2.5 Types of Disability

The 2012 Population and Housing Census collected information on six types of disability: albinism, seeing, walking, hearing, remembering, self-care and other types of disability.

These were asked through short and long questionnaire with the head of household (or other household respondent) providing information on all members of the household for these questions. The six questions are the questions from Washington Group's Short Set of questions.

Table 2.5 presents the percentage of persons with selected disabilities by region. Results show that, with the exception of albinism, prevalence rates for other type of disabilities was higher in rural than in urban areas. Results further reveal that seeing and walking were the most common type of disabilities reported.

2.6 Severity of Disability

To assess the severity of the problem for each type of disability, respondents were asked to state if they had “some difficulty”, “a lot of difficulty” or “cannot do at all”. For all types of disabilities reported. Majority of respondents reported to be at “some difficult” level of difficulty. The findings show that 7.7 percent of the disabilities were in the category of “cannot do at all” meaning those persons with disability could not perform that particular activity even with assistive devices. The findings further revealed that self-care (27.1 percent) disability had the largest proportion of persons under the category of “cannot do at all” followed by walking disability (7.4 percent) (Table 2.7). Results show that percentage of severe disability was almost equal in Tanzania Mainland (7.7 percent) and Tanzania Zanzibar (7.6 percent) and slightly higher in urban (7.8 percent) than in rural (7.4 percent) areas. The proportion of disabilities falling under “a lot of difficulty” was 18.3 percent in the rural areas and 17.8 percent in the urban areas.

2.7 Marital Status of Persons with Disability in Tanzania

In the 2012 Population and Housing Census (PHC), persons with disability like all other persons in Tanzania were asked to state their marital status as whether they were "never married", "married", "living together", "divorced", "separated" or "widowed". Data on marital status of persons with disability have been disaggregated by ten years age groups and the analysis has been done for persons of age 15 years or above.

Table 2.7 presents marital statuses of persons with disability in Tanzania. The results show that 56.3 percent of persons with disability in Tanzania were married or living together, 29.1 percent were never married and 10.3 percent were widowed.

Table 2. 7: Percentage Distribution of Persons with Disability of Age 15 Years or Above by Age Group and Marital Status; Tanzania, 2012 Census

Age Group	Total	Marital Status					
		Never Married	Married	Living Together	Divorced	Separated	Widowed

2.8 Comparison of Marital Status between Persons with and without Disability

Figure 2.2 presents information on marital status of persons with and those without disability in Tanzania. Results show that, for most categories there was not much difference between persons with and those without disabilities. However, the proportion of widowed for persons with disability (10.3 percent) was almost twice that of without disabilities (5.2 percent).

Figure 2.2: Percentage Distribution of Persons with Disability and Persons without Disability of Age 15 Years or Above by Marital Status; Tanzania, 2012 Census

Chapter Three

Literacy and Education

3.1 Overview

This chapter describes literacy and education status among persons with disability. The chapter also compares persons with and without disability in some key literacy and education indicators.

In the 2012 Population and Housing Census, persons aged four years or above were asked if they could read and write in: Kiswahili only, English only, Both Kiswahili and English or Any Other Language (s). For the purpose of this chapter the analysis includes all person of age five years or above.

3.2 Literacy Status of Persons with Disability in Tanzania

Table 3.1 presents population distribution of persons with disability aged five years and above by five-year age groups, literacy and sex. Out of 3,450,986 persons with disabilities aged 5 years and above, 2,228,280 (64.6 percent) were literate. Males with disability were more literate than females with disability. Results show that literacy rate among males with disability was 69.6 percent compared with 60.1 percent of females. However, at age group 10 – 14, the literacy rate of females with disability (80.3 percent) was higher than that of males with disability (77.3 percent).

Literacy rate of persons with disability was significantly higher in urban (81.3 percent) than in rural areas (58.7 percent) (Tables 3.2 and 3.3). This could be attributed to the fact that males have comparative advantage over females and that parents tend to send to school male children with disabilities than females. In recognition of this cultural anomaly the National Policy on Disability (2004) proposes priority attention for women with disability in the delivery of services.

The results also reveal that, at age 20 and above, literacy rate for males is relatively higher than that of females, when compared to younger ages. This can be explained by "advantage" male children had in the past when compared to girls. However, below 20 years there is no marked difference between boys and girls signifying equity in provision of education in recent years.

Table 3. 1: Number of All and Literate Persons of Age Five Years or Above with Disability and Their Literacy Rate by Five year Age Groups and Sex; Tanzania, 2012 Census

Age Group	Total Persons with Disability			Literate Persons with Disability			Literacy Rates

3.3 Comparison of Literacy Status between Persons with and without Disability

Persons without disability are more likely to be literate than those with disability regardless of their sex or area. Table 3.4 reveals that, in Tanzania 70.1 percent of persons without disability age five years or above were literate compared to 64.1 percent of person with disability. The literacy rate for females with disability in Tanzania was 60.5 percent for age five years or above point less than females without disability. For males the difference was 4.2 percent between those with and without disability.

Persons living in urban areas are more likely to be literate than those living in rural regardless of their disability status. Although over 80 percent of the persons aged five years and above were literate in urban areas, the rate was higher for persons without disability (87. 2 percent)

than those with disability (81.6 percent). In rural areas the corresponding figures were 62.5 percent for persons without disability and 58.2 percent for persons with disability.

Table 3. 4: Comparison of Literacy Rates Between Persons with and without Disability of Age 5 Years or Above and Different Sexes in Rural and Urban Areas by Type of Literacy; Tanzania, 2012 Census

Area	Type of Literacy	Persons with Disability			Persons without Disability

3.4 Education of Persons with Disability

Education is one of the most important indicators of social and economic development. Education improves capabilities and is highly associated with various socio-economic variables such as life-style, income and fertility for both individuals and society.

Tanzania has ratified and signed various international conventions and agreements that recognize the need of educational policies and practices that accommodate all learners. These include: The UN Convention on the Rights of the Child (1989), the Dakar World Education Conference (2000), the Salamanca Statement and Framework for Action (1994) and the UN Convention on the Rights of Persons with Disabilities. Despite incorporating these conventions and agreements into policies (the National Policy on Disability 2004 and the National Strategy on Inclusive Education 2013) the education system in the country is still facing challenges in achieving equal access to education for children with disability.

3.5 School Attendance for Persons with Disability

All persons of age five (5) years or above who were in the country during the census night were asked to state if they were "attending", "dropped out", "completed", or "had never been to school". For those who had dropped out or completed school a follow up question on the highest level attained was asked. (Note: *the analysis on school attendance focuses on persons of age 5 to 24 years only*)

Table 3.5 presents the school attendance status of persons of age 5 to 24 years. Results indicate that there was no significant difference between persons with or without disability who were attending school. The results show that more than half of the children with disability and those without disability were attending school at the time of Census. However, the difference in the attending status was more pronounced in rural areas where 49.2 percent of persons without disability of age 5 to 24 years were attending school compared to 36.2 percent of persons with disability. About one quarter of persons with disability of age 5 to 24 years had never attended school compared to 21.8 percent of persons without disability.

Children with disability are more likely to be attending schools in urban areas than in rural areas. This may be a result of awareness among persons living in urban areas when compared to those in rural areas, availability of friendly education facilities in urban areas or relatively shorter distances to schools in urban as compared to rural areas. Census results show that the proportion of children with disability attending school in urban areas (60.9 percent) was almost twice that of rural areas (36.2 percent).

Table 3. 5: Percentage Distribution of Persons with and without Disability of Aged 5 – 24 Years by Area, School Attendance Status, Rural/Urban and Sex; Tanzania, 2012 Census

3.5.1 Net and Gross School Enrolment Rates

In primary education, Net Enrolment Rate (NER) is defined as the number of children aged 7-13 years who are attending school divided by the total number of children in that age group. The 7-13 year age group is the official primary school age in Tanzania. On the other hand, Gross Enrolment Rate (GER) is defined as the number of children attending primary school regardless of age divided by the total number of children of age 7-13 years.

Results from the Census shows that NER and GER for persons with and without disability was almost equal indicating a positive progress in achieving equal education for all (Figure 3.1 and 3.2).

Figure 3. 1: Primary School Net Enrolment Rates of Persons with and without Disability by Sex; Tanzania, 2012 Census

Figure 3. 2: Primary Schools Gross Enrolment Rates of Persons with and without Disability and Sex; Tanzania, 2012 Census

3.6 Education Attainment

The 2012 PHC collected information on the level of education attainment for all persons of age five years or above.

Table 3.6 presents results on education attained by persons with disability of age 5 years or above by sex in Tanzania, Tanzania Mainland and Tanzania Zanzibar. Results show that majority of persons with disabilities in Tanzania (84.2 percent) had attained primary education. The situation in Tanzania Mainland was similar to that of Tanzania. However, Tanzania Zanzibar had a larger proportion of persons with disability who had attained secondary education (78.0 percent) than Tanzania Mainland (11.3 percent). The findings also revealed that, the proportion of persons with disability who attained university and other related was larger in Tanzania Zanzibar (4.0 percent) than in Tanzania Mainland (1.8 percent). The difference between Tanzania Mainland and Tanzania Zanzibar can be attributed to different education systems existing between the two parts of the Union Government.

Chapter Four

Economic Activities

4.1 Overview

The importance of statistical data on economic activities of a nation becomes clear when addressing among other things the labour market in the country. The 2012 PHC, collected information on both usual and current economic activities for all persons of age 5 years or above. However, the analysis of this chapter focuses on the current economic activities, main occupation, industry and employment status for persons of age 15 years or above.

4.2 Economic Activity Status of Persons with Disability

Table 4.1 and 4.2 give information on the activity status of persons with disability of age 15 years or above in Tanzania, Tanzania Mainland and Tanzania Zanzibar. Results indicate that in Tanzania, two-third (70.2 percent) of persons with disability were employed, about one-third (27.1 percent) were distribution inactive and just 2.7 percent were unemployed. The same distribution was observed in Tanzania Mainland.

The proportion of persons with disability who were employed was larger in Tanzania Mainland (70.7 percent) than Tanzania Zanzibar (49.9 percent). Tanzania Zanzibar had the largest proportion of inactive persons (44.1 percent) than Tanzania (27.1 percent) and Tanzania Mainland (26.7 percent). Results also show that the proportion of the economically inactive was larger for females than males in all areas. Findings from Table 4.2 reveal that the proportion employed for persons with disability was larger in rural (74.8 percent) than in urban areas (58.2 percent).The proportion that was inactive for persons with disability was larger in urban areas than in rural areas and in both areas. Results also show that females with disability were more likely to be inactive when compared males with disability.

Figure 4.1 shows the proportion of employed persons of age 15 years or above with disability. Results shows that, about one out of ten employed persons (9.4 percent) had some

type of disability in Tanzania. The proportion was slightly larger for females (9.7 percent) than males (9.1 percent). It was the same in Tanzania Mainland.

Results further show that 7.4 percent of working persons in Tanzania Zanzibar had some type of disability and the proportion was larger for females (8.0 percent) than males (7.0 percent).

Figure 4. 1: Proportion of Employed Persons of Age 15 Years or Above with Disability by Sex; Tanzania, Tanzania Mainland and Tanzania Zanzibar by Sex; Tanzania 2012 Census.

4.3 Employed Persons with Disability – Main Economic Activity

This section discusses the distribution of persons with disability of age 15 years or above by industry and age group, in Tanzania, Tanzania Mainland and Tanzania Zanzibar.

Table 4.3 reveals that nearly two thirds (67.1 percent) of persons with disability were engaged in commercial agriculture, food crops and forestry activities. Trade and commerce with 5.9 percent was the second important industry for persons with disability .In Tanzania, commercial agriculture, food crops and forestry activities employed a larger percentage of females (70.3 percent) than males (63.8 percent). It was the same thing in Tanzania Mainland.

Commercial agriculture, food crops and forestry had most of the employed persons with disability in Tanzania Zanzibar (44.2 percent), followed by fishing, hunting, livestock and other related activities (8.4 percent) and raw food sales (6.5 percent). In Tanzania Zanzibar, the percentage employed in commercial agriculture, food crops and forestry was larger for female than males. However, in fishing, hunting, livestock and other related activities the percentage was higher for males than females.

Table 4.4 reveals that the Largest proportion of employed persons with disability was of youths of age between 25-34 years (24.1 percent) followed by those of age 15-24 years (21.5 percent) and the smallest proportion was recorded for persons of age 55-64 years (9.2 percent). The table shows, employed in every industry were dominated by the 25 to 34 age group more so in the education and industry where the groups share 35.8 percent and communication and transport with 35.0 percent.

4.4 Main Occupation in Employment for Persons with Disability.

This section gives information on the main occupation in employment for person with disability.

As pointed earlier the majority of persons with disability were engaged in agriculture, commercial and food crops industries, results shows that largest proportion were dealing with farming and livestock keeping as well as fishing (Table 4.5). As might be expected females were engaged in farming activities more than males. Agriculture and fishing was the occupation of more than 70 percent of persons with disability and most of these were in 35 to 64 years age group. The information for Tanzania Mainland, Tanzania Zanzibar and by rural and urban areas are presented in Appendix 1 Tables 1.6 to 1.9

Chapter Five

Housing and Household Characteristics

5.1 Overview

This chapter presents information on household headed by persons with disability in relation to the housing conditions, household size and ownership of assets. Household tenure and Social Security Fund Membership are also explained in this chapter.

5.2 Household Headship

Figure 5:1 indicates the distribution of households headed by persons with disability by area and sex of household head. Results show that the household headship for persons with disability differs significantly between males and females. The proportion of households headed by males with disability was 68.3 percent of all household headed by persons with disability. Females with disability headed the remaining 31.7 percent of the households. The same results were observed for general household headship 33.4 percent headed by female.

Figure 5. 1: Percentage Distribution of Household Headed by Persons with Disability by Area and Sex of Head; Tanzania, 2012 Census

5.3 Housing Conditions

This part describes the source of energy used for lighting, toilets facility and tenure of the households headed by persons with disability.

5.3.1 Sources of Energy for Lighting

The main sources of energy for lighting in Tanzania are kerosene, firewood, electricity, solar energy and candles. Figure 5.2 shows that the proportion of household using electricity (TanESCO/Zeco) is lower among households headed by persons with disabilities than those headed by persons without disability (14.7 percent 20.1 presents respectively). There is no remarkable difference regarding the uses of kerosene (lantern/Chimney) (16.6 percent for HoH with disability and 17.6 percent of HoH without disability and Torch/Rechargeable Lamp (13.5 percent for HoH with disability and 14.7 percent of HoH without disability). However , the proportion of those using kerosene (Wick Lamps) is higher among household

headed by persons with disability 46.7 percent compared to those household headed by persons without disability 39.9 percent.

Figure 5. 2: Main Sources of Energy for Lighting by Disability Status of Head; Tanzania, 2012 Census

5.3.2 Toilet Facilities

Table 5.1 and 5.2 describes the types of toilet facilities used by households headed by persons with disability and without disability by area. Overall the pit latrine without washable/soil slabs was the most common type of toilet facility used by households whether headed by Persons with or without. The proportion of households that used this type of toilet was significantly higher (32.9 persons) for households headed by persons with disability than households headed by persons without disability (29.8 percent).

The second most common toilet facility was pit latrine without slab/ open pit. Results indicate that 29.6 percent of households headed by person with disability were recorded to be using pit latrine without slab/ open pit compared to 26.5 percent of households headed by persons without disability. Pit latrine with washable slab without lid was used by 9.4 percent and 11.0 percent of households headed by persons with and without disability respectively.

Results further indicate that 11.0 percent of households headed by persons with disability were using flush toilets against 14.5 percent of household's headed by persons without disability. However, the use of ventilated improved pit (VIP) latrine was higher for households headed by person without disability (1.5 percent) than for households headed by person with disability (1.2).

5.3.3 Distribution of Households by Tenure and Disability status

The ownership of dwelling is a good indicator of households' socioeconomic status. Table 5.3 and 5.4 shows the distribution of household by tenure and disability status of the households headed by persons with and without disability by residence. The table indicates that there was a big difference in the ownership of dwellings between households headed by persons with and without disability with 80.4 and 73.7 percent respectively.

In both Tanzania Mainland and Tanzania Zanzibar, the proportion of households owning dwelling was much higher for households headed by persons with disability than for households headed by person without disability. In Tanzania Zanzibar the proportion of households owning dwelling was 81.7 percent for households headed by person with disability and 77.9 percent for household headed by person without disability. In Tanzania Mainland the proportion of ownership of dwellings was much higher for household headed by persons with disability (80.4 percent) than for household headed by persons without disability (73.6 percent). Moreover results show that in Tanzania rural more household headed by persons with disability were recorded to have owned their dwellings (89.5 persons) compared to those in urban areas (55.6 percent).

5.4 Social Security Scheme Membership

Social security scheme is the government program aimed at providing basic needs to citizens in times of trouble including retirement, unemployment, and disability. Social Security Scheme includes both Social Security Fund and Medical Security Fund.

Table 5.4 shows percentage distribution of households headed by persons with disability by social security scheme membership. Results show that 10 percent of all household headed by person with disability were members in one of the social security scheme. The Scheme which were recorded to have more members than other Schemes were the National Health Insurance Fund (NHIF) and Community Health Fund (CHF) (5.6 percent). Urban areas had a higher number of households headed by persons with disability who had a membership in at least one of the Social Security Schemes (14.9 percent) than in rural areas (7.6 percent). Tanzania Zanzibar had a higher proportion of households headed by persons with disability who were Members in one of the Social Security Schemes (15.5 percent) compared with the proportion of the same type of households in Tanzania Mainland (9.4 percent).

Chapter Six

Summary, Recommendations And Conclusion

6.1 Summary

The 2012 Population and Housing Census like its predecessor of 2002 included questions on disability status. Unlike the 2002 Census impairment based questions, those of 2012 Census based questions examined activity limitations and their impact to the lives of persons with disability. The 2012 PHC results allow not only an evaluation of the magnitude and prevalence of disability levels in the country but also facilitate a critical examination of the opportunities offered to persons with disability and their involvement and participation in different activities.

The general picture generated by the results of 2012 PHC indicates that, persons with disability were disadvantaged across indicators: education, employment, health care and rehabilitation services and provisions. The need for reliable data on disability cannot be overstated. There is no doubt that lack of reliable information has negative impact on the planning for the provision of services to persons with disability in the country as well as the creation of an enabling environment for the equalization of opportunities. However, PHC is not the best mechanism for collecting information on disability. Disability is a complex subject and due to its national scale, PHC can only include a few questions. A dedicated disability survey is a vital source of information.

6.2 Recommendations

- Disability is a new dimension in the history of census in Tanzania. Structure of questions and knowledge of disability issues, among other concerns affect data adequacy, quality and reliability. The National Bureau of Statistics is encouraged to involve disability experts, service providers and persons with disability themselves in the planning and implementation of data collection activity.
- Given the complexity of census exercise and its national scale, only a few variables on disability can be accommodated. The Ministry responsible for disability and the National Bureau of Statistics in collaboration with development partners should carry an inter census dedicated disability survey that would capture more variables and thus generate more information.
- Majority of persons with disability live in rural areas while most services are concentrated in urban locations. This is an anomaly which infringes the right of persons with disability living in rural areas to receive the services they deserve. Ministries responsible for disability and local government should as a matter of

urgency take measures to reverse this trend. Deliberate efforts should be made by the government and non-governmental organizations to provide comprehensive community based services to persons with disability

- The problem of disability in the country could be effectively mitigated overtime through the introduction of early intervention services. Lack of early intervention services exacerbates the problem of disability. There is a need for the government to take concerted efforts to make early intervention a permanent agenda in health-education-social welfare services planning and implementation. Disabled Persons Organizations (DPOs) and Pro Disability Organizations (PDOs) should ensure that the government honours its obligation.
- “Nothing for us without us” is not just a slogan. It is a serious call and a reminder to stakeholders and in particular the government to make equalization and quality of life a meaningful reality in the lives of persons with disability. The government needs to take measures to ensure that persons with disability through their organizations are fully involved, represented and participate in the planning and implementation of policies and programmes and in particular those that affect them.

6.3 Conclusion:

The findings of 2012 PHC reveal that Tanzania has 34,075,839 people aged 7 years or above of whom 3,157,516 are persons with disability representing 9.3 percent of the population aged 7 years or above. The analysis of the census data excludes children with disabilities aged 0-7 years since, according to the Washington Group on Disability Statistics, this age group cannot fully explain the difficulties they experience. PHC is, admittedly, a powerful tool for gathering data and information required for among other things, development planning and services provision. Due to its national scale, a census can only accommodate a few variables on disability. The findings however underscore the disadvantaged position people with disability experience as far as participation and access to basic services is concerned. The findings show, *inter alia*, that the majority of persons with disability (0-14 years and 65 years or above) cannot fend for themselves and most of them live in rural areas with little or no access to services and support. A larger proportion of them are women (44.1 percent of 65 years or above are married). This was followed by those who were widowed accounting for 39.2 percent and the never married 6.9 percent.

Generally the proportion of children with disabilities attending school is low. With respect to housing characteristics and utilities the results show that persons with disability lagged far behind in the ownership of houses and use of utilities.

These findings constitute a final work-up call for the government and stakeholders to implement the existing policies which call for equalization of opportunities for persons with disabilities in all spheres of life.
